COMPANY PROFILE

WHO WE ARE?

Yueqing AISO Electric Co., Ltd. located in Liushi Town, Yueqing City, Wenzhou City, Zhejiang Province. We are professional electric manufacturer.

1. Quality is the first, our culture.
2. "With us your money in safe" full refund in case of bad not in accordance with technical requirements or delay delivery time.
3. "Time is gold" for you and for us, we have professional team work whom can making better quality in short time.

Please feel free to contact us for more details.
And fully utilize our 8 years experience and wide contacts.

WORKSHOP

With excellent team work, professional engineers and advanced equipments, we're able to provide quality products and offer you the best customized solutions.

CONTENTS

Committed to creating a better, safer and more efficient electrical world for global customers

ZRTBBX

Type high voltage fixed reactive power compensation complete set device

◆ General

ZRTBBX type high voltage fixed reactive power compensation complete set device (hereinafter referred to as the device) is suitable for 6～35kV AC power system with frequency of 50Hz. It is mainly used in power system to adjust bus voltage and reactive power, improve power factor, improve voltage quality and reduce network loss.

◆ Executive Standards

- GB 50227–2008 "Code for design of shunt capacitor device"
- JB/T7111–1993 "High voltage shunt capacitor device"
- JB/T10557–2006 "High voltage reactive power local compensation device"
- DL/T 604–1996 "Ordering technical conditions for high voltage shunt capacitors"

◆ Model and meaning

ZR TBBX □ – □ / □ □ □ □ □

- W: Outdoor (indoor by default)
- Reactance rate%, L is filtering
- Relay protection mode:
  K: Open triangle protection
  C: Voltage differential protection
  L: Unbalanced current protection
  Q: Bridge differential current protection
  Y: Unbalanced voltage protection
- Main connection mode:
  A: single star B: Double star
- Unit capacity (kvar)
- Rated capacity (kvar)
- System voltage (kV)
- Complete set of high voltage fixed reactive power compensation device
- Enterprise code

◆ Working conditions

4.1 Cabinet type indoor installation, frame type general outdoor installation.
4.2 The altitude of the installation operation site shall not exceed 1000m, and the place exceeding 1000m shall be ordered through negotiation.
4.3 The ambient air temperature of the installation operation site is −25℃ to +45℃ for indoor devices and −40℃ to + 45℃ for outdoor devices.
4.4 There is no severe mechanical vibration, corrosive gas and steam, and conductive explosive dust in the installation operation site.
4.5 The network or the busbar voltage connected to the installation site shall be free from the influence of higher harmonic, and waveform deviation factor and harmonic content of voltage shall not exceed the provisions of GB/T14549–93 "Voltage Quality, Harmonics in Public Supply Network".

Main technical performance index

5.1 Capacitance deviation

5.1.1 The difference between the actual capacitance and the rated capacitance of the device is within the range of 0～+5% of the rated capacitance.

5.1.2 The ratio of the maximum to the minimum capacitance between any two line terminals of the device shall not exceed 1.02.

5.2 Inductance deviation

5.2.1 Under rated current, the allowable deviation of reactance value is 0～+5%.

5.2.2 The reactance value of each phase shall not exceed ± 2% of the average value of three phases.

5.3 Insulation level

Unit: kV Table 1

Rated voltage of device	1min power frequency withstand voltage of primary circuit (root-mean-square value)	Impulse withstand voltage of primary circuit [(1.2-5)/ 50 μ s peak value]	1min power frequency withstand voltage of secondary circuit (root-mean-square value)
6	32	60	2
10	42	75	2
35	95	200	2

5.4 Overload capacity

5.4.1 Steady state overvoltage

Unit: kV Table 2

Power frequency overvoltage Un	Maximum duration	Explanation
1.10	Long-term	It refers to the maximum value of long-term overvoltage not exceeding 1.10un
1.15	30 minutes in every 24 hours	Adjustment and fluctuation of system voltage
1.20	5min	The voltage increases under light load
1.30	1min	The voltage increases under light load

5.4.2 Steady-state over-current: can run for a long time when the root-mean-square value is not more than 1.1x1.3IN.

5.4.3 When switching a capacitor with a non-rebreakdown switch, a transition overvoltage with a first peak value of not more than $2\sqrt{2}$ times the applied voltage (root-mean-square value) and a duration of not more than 1/2 cycle wave may occur. The corresponding transition over-current peak may reach 100IN, in which 1000 operations are allowed per year.

5.4.4 Maximum tolerant capacity: the total capacity does not exceed the 1.35QN within the limit of 5.4.1 and 5.4.2.

5.5 Discharge performance: 5s after power off, the voltage on each group of capacitors is less than 50V.

5.6 Apart from the protection of a single fuse (or internal fuse) for the internal fault of the capacitor, the device is equipped with different relay protection according to the main wiring mode.

5.7 The device is equipped with over-current, over-voltage and under voltage protection for system fault.

5.8 Rated capacity and overall dimension: all according to user's requirements.

Structure and working principle

6.1 The device is a cabinet structure or a frame structure, which can switch the capacitor bank manually, and can be equipped with voltage and reactive power automatic controller to auto-matically switch the capacitor bank.

6.2 The cabinet structure device consists of an incoming isolating switchgear, a series reactor cabinet, a shunt capacitor cabinet and a connected bus. The capacitor cabinet can determine the number of cabinets according to the compensation capacity and the setting scheme, which is generally composed of multiple cabinets. The cabinet body is made of high-quality cold-rolled steel plate bending welding or aluminum-zinc plate bending assembly.

6.3 Structure layout: when the rated capacity of a single capacitor is 30 kilowatts, the capacitor bank is composed of three-layer (single) double-row structure, when the rated capacity is more than 100 kilowatts, two-layer (single) double-row structure, and when the rated capacity is more than 200 kilowatts, single-layer (single) double-row structure.

6.4 Frame structure device is composed of disconnector frame, dry air core reactor, shunt capacitor frame and fence. It includes zinc oxide arrester, shunt capacitor, single protective fuse, fully sealed discharge coil, post insulator, copper (aluminum) bus bar and metal frame.

- The capacitor set is shelved on the metal frame, and the connection bus and pillar insulators are combined to form a primary circuit according to the set connection mode.
- The structure of capacitor bank is usually assembled type, with firm and stable structure, saving steel and convenient installation and transportation.
- The installation forms of capacitor can be divided into single row three layer type, double row single layer type and double layer double row structure.
- Each phase capacitor is usually connected in parallel and then in series. The surface of metal frame is hot-dip galvanized or sprayed with plastic.
- Fence (1.8m high) can be set around the whole device as required. The fence surface is sprayed with plastic. The frame material is made of high quality profiles. See Fig.11-Fig.17 for the outline and structural view.

6.5 Selection of series reactor

The series reactors installed on the neutral side generally choose the dry core reactor; the series reactors installed on the power side generally choose the air-core reactor, which can be stacked in three phases or installed in font.

6.6 Secondary protection and control

The capacitor bank adopts microcomputer capacitor protection monitoring device, which is installed on the fore high-voltage switchgear. It has two control modes: manual and remote automatic control, and the two block each other.

For the capacitor bank which needs automatic switching control, the voltage and reactive power automatic control device or power factor controller is used to automatically switch the capacitor bank through sampling, logic analysis and instruction switching switch. The controller carries RS232 or RS485 communication interface, which can be connected with other monitoring equipment in the substation to form an integrated substation automation system to meet the requirements of various operation and management modes such as unattended or undermanned substation and centralized control.

6.7 Interlock requirement

The incoming cabinet is equipped with grounding switch and circuit breaker mechanical inter-locking and electrical interlocking, and each capacitor is provided with electromagnetic lock and door lock, playing the role of safety protection. When all the cabinet doors are not allowed to close or open at will during operation, the main switch will trip immediately; for the frame structure, the user must install a mechanical coding lock on the operating mechanism of the isolating switch in the capacitor device and the fence door to form an miss operation blocking with the fore circuit breaker. The fence door must be locked before operation and must not be opened during operation, to strictly prevent the occurrence of all kinds of misoperation.

Primary wiring of compensation device

7.1 Connection mode of compensation device: there are "Y" and "Y-Y" connection modes as well as neutral non-grounding for the compensation device. The specific connection method is shown in the primary wiring diagram of each product and the primary system wiring schematic diagram of the compensation device (see Fig. 1 and Fig. 2).

◆ Ordering instructions

8.1 The user shall specify the model, specification and quantity of the order, as well as the configuration requirements of network high –order harmonic, current and voltage discharge coil, series reactor and shunt capacitor.
8.2 The user shall provide primary wiring mode and secondary protection mode, indoor layout and sectional drawing of capacitor and incoming line mode (upper incoming line, lower incoming line, left and right incoming line or cable incoming line or busbar type incoming line).
8.3 Short circuit capacity Sd at the installation place of compensation device.
8.4 Altitude, temperature and air environment conditions of installation site.
8.5 Delivery time and mode of transportation.
8.6 If you have special requirements, you can come or write to discuss.

ZRTBBZ(6 ~ 35)

Type high voltage automatic reactive power compensation complete set device

◆ General

ZRTBBZ high voltage automatic grouping reactive power compensation complete set devices (hereinafter referred to as the devices) and ZRTBBZ high voltage shunt capacitor devices are mostly cabinet structure or frame structure.

As for the cabinet structure, multi–cabinet assembly in turn. The whole cabinet is made of high–quality cold–rolled steel plate bending welding or aluminum–zinc plate bending assembly. Front and rear single or double doors, top, bottom and side sealing plate, equipped with ventilation and heat dissipation windows. The upper part of the cabinet body is provided with an instrument room, which is used for arranging the relay protection device of the unit cabinet.

As for the frame structure, it is composed of incoming isolating switch gantry, lightning arrester bracket, capacitor bank frame and series reactor, and the whole device is surrounded by steel mesh fence.

The device adopts vacuum contactor or vacuum circuit breaker and voltage and reactive power automatic control device to realize automatic switching and control of capacitor bank, which can automatically adjust busbar voltage, compensate reactive power, improve voltage qualified rate and power factor, and has the characteristics of safety, reliability, convenience and flexibility, making full use of capacitor capacity and improving use efficiency, etc..

According to the total amount of reactive power to be compensated, the device can not only automatically switch on and off the whole group of reactive power, but also is designed into several equal or unequal capacity group units according to the requirements and needs. The voltage and reactive power of the power grid are detected by the automatic switching device. The purpose of automatic capacitor switching is achieved by reasonable control and protection.

The device is suitable for power plants and electric power bureaus as well as substations with 220kV and below in large–scale factories and mining enterprises. The power supply system and frame structure of 6~10kV are widely suitable in 6~66kV power supply system. As an automatic compensation and control of reactive power, the switching function of capacitors is used to achieve the target COS ϕ or QC value set by users, so that the voltage and reactive power of the system are in the best state automatically.

The degree of automation of the device can cooperate with the integrated automatic monitoring device of the substation to realize the reactive power compensation of the unattended substation with high reliability. The device is mainly composed of a single shunt capacitor, and is equipped with a single capacitor protection fuse, a discharge coil, a zinc oxide arrester and a CKS– dry series reactor (the reactor can also be installed outside the wall), as well as a reliable vacuum contactor without reignition and no bounce, vacuum circuit breaker or sulfur hexafluoride circuit breaker as the grouping automatic switching equipment of the shunt capacitor bank, and the connecting busbar is tin plated with copper bar. Its shape and structure are shown in Fig.2 ~ Fig.7.

◆ Executive standards

- GB 50227–2008 "Code for design of shunt capacitor device"
- JB/T7111–1993 "High voltage shunt capacitor device"
- DL/T 604–1996 "Ordering technical conditions for high voltage shunt capacitors"

Working conditions

4.1 Cabinet type indoor use, frame type outdoor use.
4.2 The altitude shall not exceed 1000m; (otherwise required for more than 1000m).
4.3 The ambient air temperature is −25～40℃; the indoor ventilation and heat dissipation are good.
4.4 Relative humidity: daily average no more than 95%, monthly average no more than 90%.
4.5 There is no corrosive gas, water vapor and other serious pollution in the surrounding air, and no flammable gas, fire, and explosion danger.
4.6 Places without frequent violent vibration.
4.7 There shall be no large waveform distortion at the network and bus voltage power supply side of the installation site, and there shall be no influence of high-order harmonic source. The waveform deviation factor and harmonic content of voltage shall not exceed the provisions of GB/T14549-93 "Voltage Quality, Harmonics in Public Supply Network".

Product features

5.1 Combined into shunt capacitor banks with equal or unequal capacity, the automatic control of reactive power can be realized flexibly and the compensation is reasonable.
5.2 Simple structure, product miniaturization, a group of one control unit, up to 12 units, building block combined structure, compensation capacitance can be large or small, beautiful shape, convenient and flexible selection, low investment.
5.3 Due to the group automatic switching, the utilization rate of capacitor is high.
5.4 The frame structure is widely used outdoors, with large installation capacity and no need of buildings.
5.5 The automatic reactive power switching device can be placed in the central control room, and the automatic reactive power switching device of the cabinet-type device can also be placed in the main power supply incoming cabinet of the device, which cooperates with the fore switchgear with full protection and control function and high level of automation.
5.6 Automatic and manual operation, flexible operation, simple control, safe and reliable.
5.7 With RS232 or RS485 serial communication interface, the integrated substation automation system can be formed through the communication interface and other monitoring equipment in the substation, which can meet the requirements of many operation and management modes, such as unattended or undermanned substation, centralized control and so on.
5.8 It has over temperature and over-voltage protection alarm, internal and external fault locking function.
5.9 It has protective performance, incoming isolating and grounding interlock, when the device is out of operation, the neutral point and facies line can be grounded at the same time; it has good five-protection blocking performance.

Selection of capacity matching equipment for main basic parameters compensation device

6.1 Main technical parameter

	Equipment model	ZRTBBZ-6-□/-AK(W)	ZRTBBZ-10-□/-AK(W)	ZRTBBZ-35-□/-AKW
	Rated voltage	6 kV	10kV	35 kV
	Rated current	A	A	A
	Rated capacity	kvar	kvar	kvar
	Rated frequency	50Hz	50Hz	50Hz
	4s thermal stable current(effective)kA	20、25、31.5		
	Dynamic stable current(peak)kA	50、63、80		
	Unit capacitor model	BAM6.6/√3-□-1(W)	BAM11/√3-□-1(W)	BAM11/√3-□-1(W)
	Unit capacitor dielectric	Benzyl toluene impregnation whole membrane medium		
	Reactance rate of matching series reactor%	X K = □ %		
Performance parameter	Capacitance Deviation%	0 ~ +5%		
	Maximum ratio of three phases	≯ 1.02		
	Inductance allowable deviation%	0 ~ +5%		
	Average deviation of three phase inductance	≯ ±2%		
	Discharge energy of fuse	12kJ		
	Protection mode	Open delta voltage protection; neutral unbalanced current protection or differential current, differential current and over-current protection		
	Equipment type	Cabinet type	Cabinet type	Frame type
	Wiring mode	Single or double star		
Insulation level of capacitor	1min power frequency withstand	Alternate≥32kV To the ground≥32kV	Alternate≥42kV To the ground≥42kV	Alternate≥95kV To the ground≥95kV
	Voltage (RMS)	Test value at 1000m altitude		
	Impulse withstand voltage	≥ 60kV	≥ 75kV	≥ 200kV
	To ground (peak value)	Test value at 1000m altitude		
Insulation level of device	1min power frequency withstand	≥ 51kV		
	Voltage (RMS)	Test value at 1000m altitude		
	Impulse withstand voltage	≥ 75kV		
	To ground (peak value)	Test value at 1000m altitude		
	Secondary insulation level	≥ 2.0kV		
	Surface treatment, color	According to requirements		
	Protection level (cabinet type)	IP20	IP20	

Note: the rated insulation level should be corrected according to the altitude

6.2 The primary connection mode of the compensation device: the connection mode of the compensation device is "Y" connection mode, and neutral non-grounding. For details, please refer to the primary principle wiring Fig. 1 of the compensation device.

The specification in Table 2 adopts ZRWKG voltage and reactive power automatic control and protection device combination, which is located in the incoming cabinet and has the function of harmonic detection and alarm; GN19-12 isolating switch is adopted in the incoming cabinet, the capacitor bank adopts JCZ5-12 or VSC-12 vacuum contactor, which can be switched auto-matically or manually, and the series reactor is CKSC dry core reactor, realizing Open Triangle Voltage Protection with FDGR, and the structure is detailed in Fig.4 and Fig.5.

The device can also be equipped with ZRWKG-T voltage and reactive power automatic control, placed in the central control room, equipped with RS-232 or RS-485 communication interface to achieve remote automatic.

6.3.1 Outline drawing

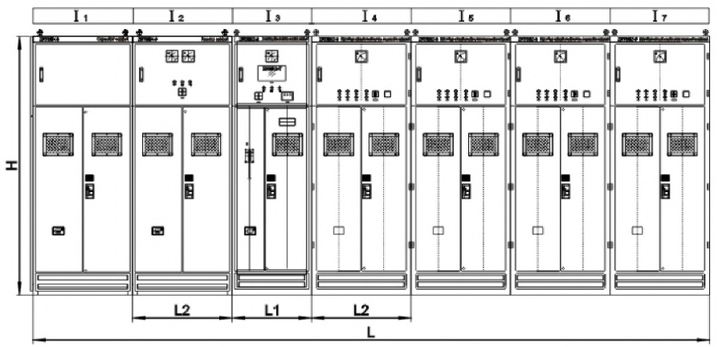

Fig. 6 The fixed group and the adjustment group were cooperated

6.3.2 Internal structure diagram

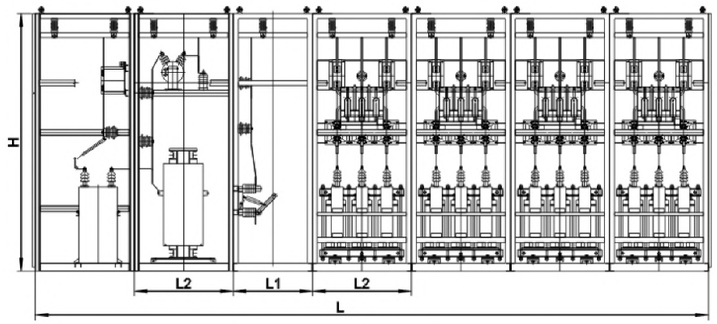

Fig. 7 Structure of fixed group and regulation group

As can be seen from Fig. 6 and Fig. 7, the device consists of a fixed switching group and four capacitor groups. The RCBK voltage and reactive power automatic controller on the incoming cabinet is responsible for the control and protection of the four capacitor banks. The controller device controls the manual and automatic switching of eight groups of capacitor banks in two busbars to realize automatic compensation under parallel operation or separate operation.

ZRTBBZ

Type outdoor box type automatic reactive power compensation complete set device

◆ General

ZRTBBZ outdoor box type automatic reactive power compensation device (hereinafter referred to as the device) is a new product which adopts preloaded box variable shell on the basis of ZRTBB to adapt to outdoor use. Vacuum contactor, load switch or vacuum circuit breaker and voltage and reactive power automatic control device are used to realize automatic switching and control of capacitor bank, which can automatically adjust bus voltage, compensate reactive power, improve voltage qualified rate and power factor, safe, reliable, convenient and flexible, making full use of capacitor capacity and improving use efficiency. According to the total amount of reactive power to be compensated, not only the whole group of reactive power can be switched on and off automatically, but also can be designed into several units with equal or unequal capacity according to the requirements and needs, and equipped with a multi-function automatic controller to control the capacitor bank according to voltage and reactive power, to achieve the purpose of reasonably adjusting voltage and compensating reactive power.

The device is suitable for power plants and electric power bureaus as well as substations with 220kV and below in large-scale factories and mining enterprises and power supply system of 6~10kV. As an automatic reactive power compensation control, capacitors are automatically switched on and off according to the measured voltage and reactive power or power factor.

The automation degree of the device can cooperate with the integrated automation monitoring device of the substation to realize the reactive power compensation of unattended substation with high reliability.

◆ Executive standards

- GB 50227-2008 "Code for design of shunt capacitor device"
- JB/T7111-1993 "High voltage shunt capacitor device"

◆ Working conditions

4.1 Outdoor use.
4.2 The altitude shall not exceed 1000m; (otherwise required for more than 1000m).
4.3 The ambient air temperature is −25～40℃.
4.4 Relative humidity: daily average no more than 95%, monthly average no more than 90%.
4.5 There is no corrosive gas, water vapor and other serious pollution in the surrounding air, and no flammable gas, fire, and explosion danger.
4.6 Places without frequent violent vibration.
4.7 There shall be no large waveform distortion at the network and bus voltage power supply side of the installation site, and there shall be no influence of high−order harmonic source. The waveform deviation factor and harmonic content of voltage shall not exceed the provisions of GB/T14549−93 "Voltage Quality, Harmonics in Public Supply Network".

◆ Product features

ZRTBBZ high voltage shunt capacitor box type reactive power compensation device is outdoor box type. The front and rear doors of the box and the eave−type roof are suitable for wind and rain, cold and high temperature environment. There is front−operation in the box. The box body can adopt protective color light plate, aluminum−zinc coated plate, stainless steel plate or ordinary steel plate, and the front−and−rear−open double−door structure.

The device consists of more than two capacitor banks and a circuit breaker (switch) cabinet. The capacitor bank is of cabinet structure with vacuum contactor (or vacuum circuit breaker), capacitor unit, fuse, discharge coil, zinc oxide arrester and series reactor. The vacuum contactor (or vacuum circuit breaker) is used as the switching equipment of shunt capacitor bank, and the connecting bus adopts tinned copper bar.

5.1 The capacitor bank can be composed of equal or unequal capacity, which is easy to realize reasonable compensation.
5.2 The structure is simple, the product is miniaturized, the building block type combination type, and the investment is saved.
5.3 Due to the use of grouping automatic switching, the utilization rate of capacitor is high.
5.4 Due to the use of microcomputer protection and automatic switching device, the protection and control functions are complete and the degree of automation is high.
5.5 It has RS232 or RS485 serial communication interface, which can be connected with other monitoring equipment in the substation to form a substation integrated automation system, which can meet the requirements of many operation and management modes, such as unattended or undermanned substation, centralized control and so on.
5.6 Interlock requirement: the incoming cabinet is equipped with grounding switch and circuit breaker mechanical interlocking and electrical interlocking, and each capacitor is provided with electromagnetic lock and door lock, playing the role of safety protection. When the rear door and the front door of the box are closed, the main switch will trip immediately if switch on normally or if it is opened at will; the front and rear door of the box body is also equipped with a padlock to strengthen the management.

◆ Technical parameter

6.1 The device can operate continuously at 1.1 times of rated voltage and 1.43 times of rated current.
6.2 The rated voltage of the device is 6kV or 10kV, and the rated total capacity is 1000−10000kvar.
6.3 The open−delta voltage protection is generally used in the single star connection, and the neutral unbalanced current protection is used in the double star connection.
6.4 The device adopts CKSC three−phase iron core series reactor or CKGKL three−phase air −core series reactor, which is used to reduce the inrush current and operating overvoltage when the complete set is put into operation and to restrain the influence of higher harmonics. The insulation grade of the reactor is bus rated voltage, and the rated current is the same as that of the complete set of device. The rated capacity is generally considered according to the total nominal capacity of the complete set of device.

6.5 The deviation of the measured capacitance of the capacitor bank shall not exceed 0～+5% of the rated value: the maximum and minimum capacitance between any two line terminals of the three−phase capacitor bank shall not exceed 1.02, and the maximum and minimum capacitance between each series section shall not exceed 1.02.
6.6 For a capacitor bank with a series of three−phase reactors, the reactance value of each phase does not exceed ±2% of the three−phase average.

6.7 Technical parameter

ZRTBBH

Type integrated reactive power compensation device

General

ZRTBBH type integrated high voltage shunt capacitor device is used in power frequency power system with rated voltage above 6–35kV. It is used to improve power factor, improve and improve power supply quality, adjust network voltage and reduce line loss.

Executive standards

- GB 50227–2008 "Code for design of shunt capacitor device"
- JB/T7111–1993 "High voltage shunt capacitor device"
- JB/T10557–2006 "High voltage reactive power local compensation device"
- DL/T 604–1996 "Ordering technical conditions for high voltage shunt capacitors"

Model and meaning

Working conditions

4.1 Installation environment: outdoor or indoor.
4.2 Altitude: no more than 1000 m.
4.3 Ambient temperature: –40℃ ~ +45℃.
4.4 Relative humidity: monthly average no more than 85%.
4.5 Anti–pollution ability: the leakage distance of external insulation is not less than 25mm/kV (relative to the maximum operating voltage of the system). The leakage distance should be increased appropriately for the heavily polluted area.
4.6 There is no corrosive gas and steam in the installation site, and there is no conductive and explosive dust.
4.7 Places without frequent violent vibration.
4.8 There shall be no large waveform distortion at the network and bus voltage power supply side of the installation site, and there shall be no influence of high–order harmonic source. The waveform deviation factor and harmonic content of voltage shall not exceed the provisions of GB3983.

Main technical performance index

5.1 Capacitance deviation
5.1.1 The difference between the actual capacitance and the rated capacitance of the device is within the range of 0 ~ +5% of the rated capacitance.
5.1.2 The ratio of the maximum to the minimum capacitance between any two line terminals of the device shall not exceed 1.02.
5.2 Inductance deviation
5.2.1 Under rated current, the allowable deviation of reactance value is 0 ~ +5%.
5.2.2 The reactance value of each phase shall not exceed ± 2% of the average value of three phases.

5.3 Insulation level

Unit: kV Table 1

Rated voltage of device	1min power frequency withstand voltage of primary circuit (root–mean–square value)	Impulse withstand voltage of primary circuit [(1.2–5)/ 50 μ s peek value]	1min power frequency withstand voltage of secondary circuit (root–mean–square value)
6	32	60	2
10	42	75	2
35	95	200	2

5.4 Overload capacity
5.4.1 Steady state overvoltage

Unit: kV Table 2

Power frequency overvoltage Un	Maximum duration	Explanation
1.10	Long–term	It refers to the maximum value of long–term overvoltage not exceeding 1.10un
1.15	30 minutes in every 24 hours	Adjustment and fluctuation of system voltage
1.20	5min	The voltage increases under light load
1.30	1min	The voltage increases under light load

5.4.2 Steady–state over–current: can run for a long time when the root–mean–square value is not more than 1.1x1.3IN.
5.4.3 When switching a capacitor with a non–rebreakdown switch, a transition overvoltage with a first peak value of not more than 2√2 times the applied voltage (root–mean–square value) and a duration of not more than 1/2 cycle wave may occur. The corresponding transition over–current peak may reach 100IN, in which 1000 operations are allowed per year.
5.4.4 Maximum tolerant capacity: the total capacity does not exceed the 1.35QN within the limit of 6.4.1 and 6.4.2.
5.5 Discharge performance: 5s after power off, the voltage on each group of capacitors is less than 50V.
5.6 All integrated capacitors used in complete sets have internal fuses as internal fault protection.
5.7 The complete set of device is provided with an external capacitor discharge circuit, and the discharge device forms an external voltage protection secondary circuit.

Ordering instructions

7.1 The user shall specify the basic parameters and technical requirements (including the use requirements, structure and conductor requirements, equipment selection, protection and control mode selection and performance requirements, etc.) such as model, speci–fication, quantity and network high–order harmonic.

7.2 The user shall provide the primary wiring mode and secondary protection mode, provide the layout plan of capacitor device, and provide the incoming line mode (cable incoming line or bus incoming line).

7.3 The model selection of main equipment, such as disconnector, reactor, assembling capacitor, discharge coil and arrester, shall be selected by our company or specified by users.

7.4 Delivery date.

7.5 If you have special requirements, you can write to discuss.

ZRTBBZ

Type outdoor frame type automatic reactive power compensation device

General

ZRTBBZ outdoor frame type automatic reactive power compensation device is suitable for reactive power compensation on the 10kV or 6kV side of substations or industrial and mining enterprises, which can effectively increase power factor, reduce power loss, improve power supply quality and increase the output of main transformer.

The product is installed outdoors and consists of disconnector, vacuum contactor for switching shunt capacitor bank, lightning arrester, high voltage shunt capacitor, series reactor, discharge coil, spraying fuse, automatic control and protection device for reactive power compensation, installation framework, fittings, busbar, safety fence, etc.

The device is divided into several capacitor banks, which is controlled by a microcomputer controller and automatically switched by a vacuum contactor according to the system load to realize automatic reactive power compensation. The device is equipped with various complete protection functions, such as open-delta unbalanced voltage, single capacitor fault, short circuit, over-current, overvoltage, undervoltage, loss of voltage and so on.

The device conforms to GB 50227-2008 "Code for design of shunt capacitor device", JB/T 7111-1993 "High voltage shunt capacitor device", DL/T 604-1996 "Ordering technical conditions for high voltage shunt capacitors", etc. All electrical components of the device meet relevant standards.

Working conditions

3.1 Ambient air temperature: -40℃ ~ +45℃.
3.2 Altitude: no higher than 2000m.
3.3 Sunshine: the amplitude (Max.) is 0.1w/cm².
3.4 Wind speed: no more than 35m/s.
3.5 Earthquake: intensity no more than 8.
3.6 Installation site conditions: no severe mechanical vibration; no harmful gases and steam; no conductive or explosive dust.

Note: Plateau products and products with special environmental requirements can be settled through negotiation.

Main technical performance index

4.1 Rated voltage: 6kV or 10kV.
4.2 Rated frequency: 50 Hz.
4.3 Maximum capacity of device: 20000kvar.
4.4 Maximum capacity of single group: 3000kvar.
4.5 Rated reactance rate: 0.1%~1%, 4.5% ~ 6%, 12%~13%.

Performance

5.1 Capacitance deviation
5.1.1 The difference between the actual capacitance and the rated capacitance of the device is within the range of 0~+5% of the rated capacitance.
5.1.2 The ratio of the maximum to the minimum capacitance between any two line terminals of the device shall not exceed 1.02.
5.2 Inductance deviation
5.2.1 Under rated current, the allowable deviation of reactance value is 0~+5%.
5.2.2 The reactance value of each phase shall not exceed ± 2% of the average value of three phases.

5.3 Insulation level

Unit: kV Table 1

Rated voltage of device	1min power frequency withstand voltage of primary circuit (root-mean-square value)	Impulse withstand voltage of primary circuit [(1.2-5)/ 50 μ s peak value]	1min power frequency withstand voltage of secondary circuit (root-mean-square value)
6	32	60	2
10	42	75	2

5.4 Overload capacity
5.4.1 Steady state overvoltage

Unit: kV Table 2

Power frequency overvoltage Un	Maximum duration	Explanation
1.10	Long-term	It refers to the maximum value of long-term overvoltage not exceeding 1.10un
1.15	30 minutes in every 24 hours	Adjustment and fluctuation of system voltage
1.20	5min	The voltage increases under light load
1.30	1min	The voltage increases under light load

5.4.2 Steady-state over-current: can run for a long time when the root-mean-square value is not more than 1.1x1.3IN.
5.4.3 Limit inrush capacity: the inrush current generated at the moment of input of the capacitor bank is limited to less than 20 times the rated current of the capacitor bank.
5.4.4 Transition overvoltage: the device selects a special sulfur hexafluoride load switch for switching capacitors, and there is no heavy breakdown when switch on and off.
5.5 Discharge performance: five seconds after the power failure, the voltage on each group of capacitors is lower than 50V.
5.6 structure: the device is installed with hot-dip galvanized frame and protected by safety fence.
5.7 Protection: spray fuse is used as the main protection of capacitor, and open triangle unbalanced voltage is used as backup protection. The controller and switch can also realize the protection of over-current, over-voltage, under voltage, loss of voltage and fault locking, and other protection functions can be set according to the user's requirements.
5.8 Interlocking: "five prevention" can be achieved by installing electromagnetic lock, travel switch, auxiliary switch, program sequence lock, etc.

Ordering instructions

Please provide the following information when ordering:

8.1 The scheme of primary circuit, number of groups, capacity of each group, reactance rate, etc. shall be specified in detail.

8.2 Specify the scope of supply, the name and quantity of spare parts and spare parts in detail.

8.3 Electrical components and parameters with special requirements.

8.4 Delivery time and mode of transportation.

8.5 Other special requirements.

ZRTBBZW

Pole mounted outdoor line reactive power compensation complete set device

◆ General

ZRTBBZW pole mounted outdoor line reactive power compensation complete set device (hereinafter referred to as the device) is suitable for 10kV or 6kV high-voltage distribution lines with rated voltage. It is used to improve power factor, reduce line loss and improve voltage quality.

The device is composed of full film high-voltage shunt capacitor, vacuum contactor for outdoor switching capacitor (with internal current transformer), control power transformer, zinc oxide arrester, drop out fuse, automatic controller for reactive power compensation, outdoor high-voltage current transformer and installation fittings. Complete configuration, compact structure and convenient installation.

According to the actual needs of the line, the device can be set in advance by the user and controlled by a microcomputer to realize the automatic switching of the shunt capacitor, so that the power factor of the line can reach the predetermined range. At the same time, it has the protection functions of short circuit, over-current, overvoltage, undervoltage, loss of voltage, prevention of capacitor charging closing, lack of phase, fault locking, self-diagnosis and so on. Moreover, various parameters can be changed at any time.

The outdoor high voltage vacuum AC contactor used in this device is a special switch for switching high voltage shunt capacitor banks developed by our company. It can absolutely guarantee " closing without bounce" and " opening without reignition" , and the service life of electrical machinery can reach more than 300000 times.

The device meets the industry standards of JB/T10558-2004 " Column type high voltage reactive power compensation device" , JB/T7111-1993 " High voltage shunt capacitor device" , DL/T604-2009 "Ordering technical conditions for high voltage shunt capacitors" and enterprise standard of Q/NR "TBBZ column type automatic switching high voltage shunt capacitor device".

◆ Performance introduction

6.1 Capacitance deviation

6.1.1 The difference between the actual capacitance and the rated capacitance of the device is within the range of 0～+5% of the rated capacitance.

6.1.2 The ratio of the maximum to the minimum capacitance between any two line terminals of the device shall not exceed 1.02.

6.2 Insulation level

Table 3

Rated voltage of device	1min power frequency withstand voltage of primary circuit (root-mean-square value)	Impulse withstand voltage of primary circuit [(1.2-5)/ 50 μ s peak value]	1min power frequency withstand voltage of secondary circuit (root-mean-square value)
6	32	60	2
10	42	75	2

6.3 Withstand short circuit current capacity

Main circuit electrical equipment and the withstand short circuit current of conductor is 12.5kA, 2S.

6.4 Overload capacity

6.4.1 Steady state overvoltage

Table 4

Power frequency overvoltage Un	Maximum duration	Explanation
1.10	Long-term	It refers to the maximum value of long-term overvoltage not exceeding 1.10un
1.15	30 minutes in every 24 hours	Adjustment and fluctuation of system voltage
1.20	5min	The voltage increases under light load
1.30	1min	The voltage increases under light load

6.4.2 Steady-state over-current:

can operate for a long time under 1.3 IN.

6.4.3 Maximum allowable capacity:

within the limits of 6.4.1 and 6.4.2, the total capacity shall not exceed 1.35QN.

5.5 Discharge performance:

10min after power off, the voltage on each group of capacitors is less than 50V.

6.6 Structure

6.6.1 The metal exposed surface of all electrical equipment shall be sprayed with paint or electro-plating, and the installation fittings shall be hot-dip galvanized.

6.6.2 Minimum electrical clearance

Table 5

Relevant position	Minimum electrical clearance of main circuit	Minimum electrical clearance of auxiliary circuit
Between electrified bare conductors of different phases	200	4
Between electrified bare conductor and grounding body	200	15
Between electrified bare conductor and ground	3000	-

6.6.3 Protection grade of electrical equipment enclosure

The protection grade of the metal enclosure for the installation of electrical equipment is IP33.

6.7 Protection of the device includes short circuit, over-current, over-voltage, under voltage, loss of voltage, phase loss protection, which preventing capacitor closing with charge and switching oscillation. The specific settings are as follows:

6.7.1 Phase to phase short circuit of main circuit: drop fuse acts to cut off fault phase, switch slightly belt time limit (delay 0.2～0.5S) acts on tripping, exits operation and locks itself.

6.7.2 Short circuit of capacitor bank to neutral point: slightly time limit (delay 0.2～0.5S) acts on tripping and locks automatically. Setting value: 3In.

6.7.3 Over current of capacitor bank: act on tripping with time limit (delay 5S) and self locking. Setting value: 1.4～1.5In.

6.7.4 Overvoltage: act on tripping with time limit (delay 20～30S). Setting value: 1.1～1.3un.

6.7.5 Lightning overvoltage: it is protected by gapless zinc oxide arrester.

6.7.6 Under voltage: slightly time limit (delay 0.2～0.5S) acts on tripping. Setting value: 0.6Un.

6.7.7 Voltage loss: slightly time limit (delay 0.2～0.5S) acts on tripping.

6.7.8 Phase loss: any phase breaking is operated by tripping and locking automatically.

6.7.9 Prevent capacitor closing with charge: delay 10 min before putting capacitor bank into operation.

6.7.10 Anti-switching oscillation: when the switch is closed, the controller has calculated the reactive power gap of the line and set the reactive power backlash and voltage backlash. Only when the reactive power exceeds the capacitor capacity can the capacitor be put into operation. A certain delay is needed before putting into the capacitor to prevent switching oscillation caused by partial spikes or interference.

◆ Technical parameters, performance and structure of main electrical equipment

8.1 High voltage shunt capacitor

It meets the requirements of GB/T11024.1～4-2001 "shunt capacitors for AC power systems with nominal voltage above 1kV". Performance is shown in Table 8.

Table 8

Capacitance deviation: the difference between the measured value and the rated value is 0 ～5%, and the capacitance ratio between any two line terminals is ≤ 1.02	
Dielectric loss tangent: tg δ < 0.0005	
Low temperature partial discharge level: extinction voltage > 1.15UN	
Shell bursting capacity: not less than 15kJ	
Sealing performance: no leakage	
Liquid medium: M/DBT(C101) or PXE (soil)	
Solid medium: double coarsened polypropylene film	
Component structure: aluminum foil folding, convex foil lead	
Oil injection mode: pressure oiling	
Insulation level: 2.15UN, 10S between terminals	
Between terminal and shell: UN=6.6, 6.6√13	25kV 1min, lightning impulse 60kV
UN=11, 11√13	42kV(Dry)30kV(Wet)1min, lightning impulse75kV

8.2 ZW18 high voltage outdoor AC vacuum contactor

The capacitor bank specially designed and developed by our company is specially used for switching on and off high breaking speed, which completely eliminates the phenomenon of "closing bounce" and "switching off re ignition". With the automatic reactive power compensation controller, the automatic switching and relay protection can be realized. Performance is shown in Table 9.

Table 9

1	Rated voltage: 12kV
2	Rated current: 400A, 630A
3	Maximum breaking current: 200A, 300A
4	Insulation level: 42kV (dry and wet) for 1min
5	Lightning impulse: 75kV (peak value)
6	Electrical and mechanical life: > 100000 times
7	Release: shunt excitation, voltage loss (delay)
8	Operating mechanism voltage: 220 V+10% -20%, AC
9	Rated short time withstand current: 12.5kA, 4S
10	Rated peak withstand current: 31.5kA (peak value)
11	Rated short circuit making current: 31.5kA (peak value)
12	Average closing speed: 2.5～4m/S
13	Average opening speed: 3.5～5m/S
14	Closing bounce time: 0
15	Three phase different periodicity: ≤ 0.5ms
16	Others: internal CT

8.3 Automatic controller for high voltage reactive power compensation

ZRGKWN high voltage reactive power compensation automatic controller is a high-tech product specially designed and developed for pole top automatic switching high voltage shunt capacitor device, which has high reliability, strong anti-interference ability and other functions. The controller is installed in a special control box, which is installed separately from the capacitor bank. The controller has a variety of specifications and is configured according to the user's selection of the device (see 4.2). Performance is shown in Table10.

Table 10

Rated voltage: 220 ± 20%V, AC			
Rated frequency: 50 ± 2.5Hz		EMC perform-ance	Anti high frequency interference: 1MHz, 1000Hz
Power consumption: ⩽ 5W			Common mode 2kV, differential mode 1kV, 50 time/s
Output contact capacity: 10A, 220V AC			Electrical fast transient burst immunity: severity level 4
Analog input voltage: 220 (80% ~120%) VAC			Electrostatic discharge immunity: severity level 3
Analog input current: 5 (10% ~100%) a			Radiated electromagnetic field immunity: severity level 3
Loop resistance: voltage loop > 20KΩ, current loop < 0.1Ω			Protection function: over voltage, over current, under voltage, to prevent capacitor closing with charge and phase loss.
Insulation level: 1 min power frequency withstand voltage 2500V			
Measurement error: voltage and current ± 0.5%, time < 1s/d, reactive power ±3%			Display function: voltage, line current, reactive power, power factor, device current, operation time accumulation, year, month, day, hour, minute, action times accumulation.
Action error: ± 1%			
Control mode	① According to voltage	Self check function	Self check recovery
	② By time		Operation status of capacitor
	③ According to time and voltage		Over current diagnosis
	④ According to power factor		Locking function: automatic controller fault, short circuit, over-current trip, phase loss
	⑤ According to voltage and reactive power		Other functions of advanced products: short distance or long distance remote control, tele-metry, remote adjustment, remote signaling.
	⑥ Remote control		
Setting function	1) Year, month, day, hour, minute	Record-ing function	Various setting parameters
	2) Rated voltage		Cumulative switching times
	3) Transformation ratio of voltage transformer		Accumulative operation time
	4) Transformation ratio of current transformer		SOE document records:
	5) Ratio correction		Daily maximum (low) voltage and time
	6) Input threshold (voltage, power factor)		Daily maximum (low) current and time
	7) Cut off threshold (voltage, power factor)		Daily maximum (low) power factor and time
	8) Investment time		Protection action before and after the data
	9) Resection time		Blackout time record
	10) Overvoltage and delay time		Power on time record
	11) Under voltage and delay time		Data storage for 60 days
	12) Over current and delay time		Current running data download
	13) Over current quick break and delay time	Communi-cation function	SOE file record download
	14) Voltage return difference		Setting value download and modification
	15) Reactive power return difference		Sending and receiving remote switching SMS
	16) Switching mode selection		
	17) Daily switching times		

Note: different specifications of automatic controller have different functions, some or all of them have the functions listed in the table.

8.4 Control power transformer

JDZC voltage mutual inductor type control power transformer is an outdoor product with both voltage mutual inductor and transformer functions. It is poured with epoxy resin and connected to the control box with aerial linker. Performance is shown in Table 11.

Table 11

Rated voltage (kV)	Rated capacity (VA)	1min power frequency withstand voltage(effective)kV	Lightning impulse (peak value)kV	Accuracy level
10/0.22	Long-term 1000VA	High voltage side 42, low voltage side 3	75	Grade 1.0
6/0.22	Long-term 1000VA	High voltage side 25, low voltage side 3	60	Grade 1.0

8.5 Outdoor high voltage current transformer

LZKW-10 outdoor high voltage current transformer is molded with special materials, which has the characteristics of anti-aging, anti-radiation, full insulation and so on. Small size, light weight, simple and convenient installation, no need to cut the current carrying wire, reliable operation. The performance is as follows:

Maximum working voltage: 12kV; accuracy level: 0.5

Rated primary current: 100~500A; rated secondary current: 5A

Rated output: 10VA

8.6 Metal zinc oxide arrester

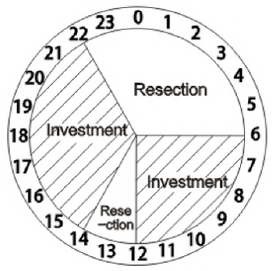
HY5WS organic composite sheath metal zinc oxide arrester is used for atmospheric overvoltage protection.

Table 12

Model of arrester	System rated voltage	Rated voltage of arrester kV(effective value)	Maximum residual pressure(peak value) Continuous operating voltage kV(effective value)	1/5μS under steep impulse current	8/20μS under lightning impulse current	DC reference voltage kV (peak value) 1mA	30/60μS under switching impulse current	Current impulse withstand Square-wave current A (peak value) 2ms	Impulse current kA 8/20μS	Impulse current kA(peak value) 4/10μS
	kV	kV	kV	⩾	⩽	⩽	⩽	A	kA	kA
HY5WS-10/30	6	10	8.0	15.0	34.6	30.0	25.6	75	5	25
HY5WS-17/50	10	17	13.6	25.0	57.5	50.0	42.5	75	5	25

8.7 Drop-out fuse

Selecting RW10-10 drop-out fuse, according to user's requirements, can provide breaking capacity 100 or 200MVA products. There are products specially designed for use in heavily polluted areas with a leakage distance per unit withstand voltage larger than 32mm/kV.



◆ Automatic switching mode

9.1 Switching mode by time

When the distribution line load changes with time, this switching mode can be selected.

You can pre-set 24 hours a day to 2 or 4 periods for cyclic switching, for example:

9.2 Switching mode according to voltage

This switching mode is suitable for distribution lines with various load changes. The input threshold and the cut-off threshold can be set in advance. When the line voltage is lower than the input threshold, the device will automatically put the capacitor into operation; and when the line voltage is higher than the cut-off threshold, the capacitor will be cut off automatically. The threshold voltage can be preliminarily determined with reference to the following methods.

a) Through calculation or field measurement, the minimum voltage (Umin) at the maximum load at the installation site and the maximum voltage (Umax) at the light load are determined;

b) A Umin is used as the input threshold voltage (Ud), which should be slightly higher than the average voltage (Uj) at the installation site but not higher than the rated voltage (Un) of the line.

A is the coefficient, when Umin ≤ 0.93Un, A=1.03 ~ 1.08
0.96Un > Umin > 0.93Un, A=1.01 ~ 1.05
Umin ≥ 0.96Un, Ud=Un

c) Umax+ΔU is used as the cut-off threshold voltage (Ug), which should be lower than the maximum voltage of the power station bus.

ΔU is the voltage rise value after the capacitor is put into operation

$\Delta U = Un \frac{Q}{S}$

Q —— Capacity of capacitor bank kvar

S —— Short circuit capacity at installation site kVA

Explain:

① The threshold set by the above method should also be tested and adjusted on the spot.

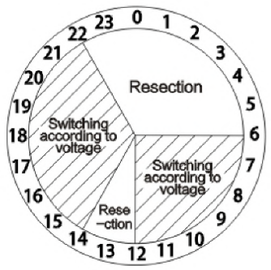
② When the average line voltage is higher than UN, the threshold voltage will be greater than UN.

For example: Un=10kV, Q= 600kvar, short-circuit capacity at installation site
S= 30MVA = 30×103kVA, Umin = 9.2kV, Umax = 10.3kV.

Input threshold: Ud=AUmin=(1.03~1.08)×9.2=9.48~9.94kV, and Ud= 9.8kV can be set;

Resection threshold: Uq=Umax+Un=10.3+10×=10.5kV, and Uq= 10.5kV can be set.

Note: in order to prevent switching oscillation, the difference between Ud and uq should be as large as possible without affecting normal switching.



9.3 Switching mode according to time and voltage

This switching method makes up for the shortcomings of the above two methods and expands the scope of switching threshold. The details are as follows:

a. Set 24 hours a day to 2 or 4 periods, the investment time can be artificially extended when setting up.

b. Set the input threshold voltage and the cut-off threshold voltage.

c. In the input period, the device switches the capacitor according to voltage, and in the cut-off period, the capacitor is cut off and not put into operation.

9.4 Switching mode according to power factor

Because this method limits the capacity of the device (less than 80% of the total reactive power from the installation to the end), it should not be used for the main purpose of loss reduction, but can be used when most of the load is concentrated at the end or only for the purpose of increasing the power factor. Multi-point compensation can be used at the compensatory point on the side of the power station.

In this way, the upper and lower limits of the power factor are set in advance. In order to prevent switching oscillation, the difference between the upper and lower limits should be as large as possible. In addition, the device also sets the reactive power return difference, which is normally set to 1.1~1.3 times the device capacity. Put the capacitor when the power factor at the installation is lower than the lower limit of the power factor and the total reactive power from the installation to the end of the line is greater than 1.1~1.3Q, and cut off the capacitor when the power factor is higher than the upper limit.

9.5 Switching mode according to voltage and reactive power

In this method, the upper and lower threshold of voltage and reactive power should be set in advance, in which the voltage is priority, that is, put the capacitor when the voltage is less than the lower limit of voltage, the capacitor is cut off when the voltage is greater than the upper limit of voltage, and control according to reactive power when the voltage is between the upper and lower threshold, at this time, the capacitor is put into if the reactive power is greater than the upper limit of reactive power, or cut off if the reactive power is less than the lower limit of reactive power.

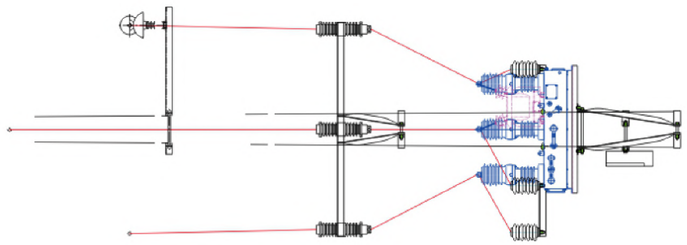
This control method needs to calculate the reactive power before the compensatory point in advance, so that the reactive power can be sent up to the compensatory point, but the reactive power along the compensatory point is not a fixed value, so this control method is more suitable for reactive power compensation at the outlet of the power station, because the reactive power loss of the main transformer is relatively stable.

9.6 Power station remote control switching mode

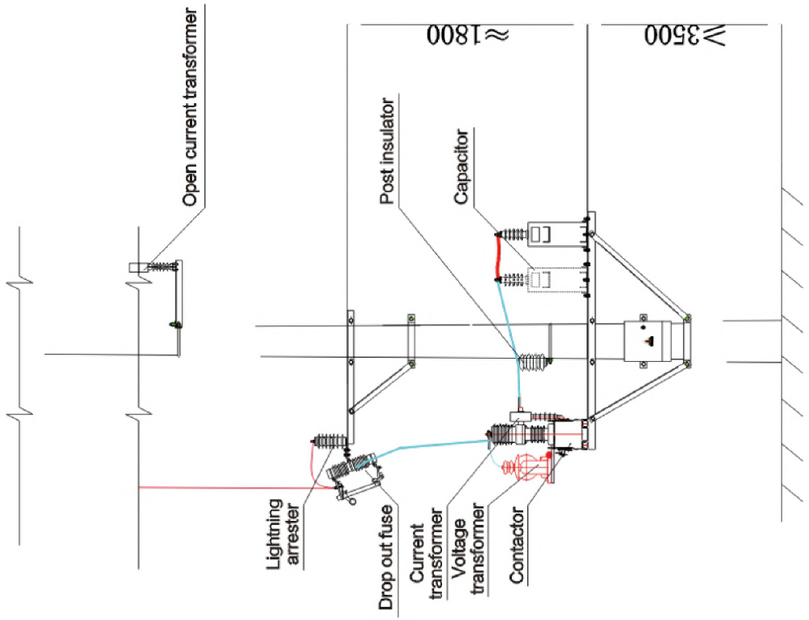
In this way, the monitoring system of the power station, after measuring the relevant data of the high voltage distribution line, such as voltage, current, active power, reactive power, power factor, etc., is processed by the computer and remotely controls the remote terminal (RTV)-pole top compensation device to realize automatic switching, and at the same time, using GSM commu-nication network, RTV automatically transmits the operation information (put, cut off, fault) and measured data (voltage, current, reactive power, power factor, harmonic voltage, harmonic current, daily voltage peak and time, daily voltage trough and time, daily peak load and time zone, daily low peak load and time zone, etc.) of the pole top device to the power station or other receiving devices by means of SMS, voice and data. It can also carry out remote monitoring, monitoring or parameter adjustment of the pole top device at any time, so as to realize the four remote (remote control, remote metering, remote signal, remote adjustment). This is a very ideal way, for it can not only switch capacitors according to the actual needs of line reactive power, but also monitor in time.

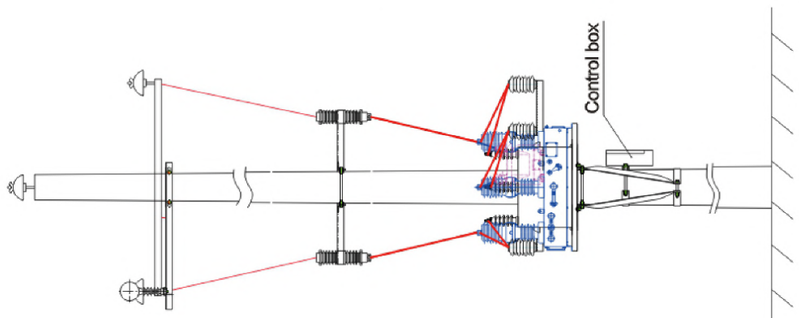
9.7 Selection of automatic switching mode

No.	Automatic switching mode	Application conditions	Remarks
1	Time	The change of reactive power load is very regular, heavy load and light load are concentrated in one or several time periods respectively within 24 hours of the whole day.	Optional
2	Voltage	The change of reactive power load is irregular, and there is no obvious light load period in 24 hours of the whole day.	Optional
3	Voltage and reactive power	The change of reactive power load is irregular, and there are obvious periods of light load in 24 hours of the whole day.	Preference
4	Power factor	The main purpose of compensation is to improve the power factor. Two or more points of compensation are installed near the power station.	Use as little as possible
5	Time, voltage	The main purpose of compensation is to improve the power factor. Two or more points of compensation are installed near the power station.	Optional
6	Remote control of power station	It is suitable for all kinds of reactive load changes. There is a monitoring automation system in the power station.	Preference for qualified candidates



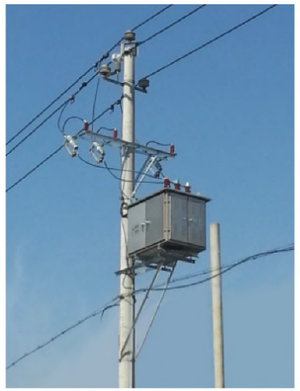
Single pole installation diagram





ZRTBBZW

Pole mounted outdoor line reactive power compensation device



◆ General

ZRTBBZW pole mounted outdoor line reactive power compensation device is suitable for installation in 10kV and 6kV distribution lines. It can effectively improve power factor, reduce line loss and improve voltage quality.

The device is composed of full-film high-voltage parallel capacitor (built-in discharge resistance), special high-voltage vacuum contactor, control power transformer, high-voltage current mutual inductor, zinc oxide lightning arrester, drop-out fuse, automatic reactive power compensation controller, device box and hardware wire, etc. According to the needs of the line and pre-set by the user, the automatic switching of the shunt capacitor (according to time, voltage, power factor or reactive power) is realized, and the power factor reaches the predetermined range. At the same time, it has the protection functions of short circuit, over-current, over-voltage, under-voltage, lack of phase and preventing capacitor from closing with charge, etc.. The selected high voltage vacuum contactor is specially treated and has the characteristics of long life and frequent operation, so it is suitable for switching capacitors. The automatic controller has strong anti-interference ability, which can ensure the reliable operation of the device. In addition, the controller can have a serial interface, and close-range wireless remote control or remote GPRS remote control can be realized after accessing relevant modules according to the needs of different users.

The device has a variety of grouping compensation schemes to choose from, which can be compensated by single group or multi-group automatic compensation, or by automatic group reinforcement. Users can choose the corresponding grouping scheme according to the load characteristics of the line to make the reactive power compensation more accurate.

Standards: JB/T 10558-2006 "Column type high voltage reactive power compensation device", GB/T 50227-2008 "Code for design of complete set of shunt capacitor device", JB/T 7111-1993 "High voltage shunt capacitor device", DL/T604-1996 "Ordering technical conditions for high voltage shunt capacitors', etc. All electrical components meet the require-ments of relevant standards.

◆ Model and meaning

ZR TBBZW □-□ □

- Fixed group capacity (G/minimum loss of compensation line)
  automatic group capacity (omitted)
- Rated capacity (kvar)
- Rated voltage (kV)
- Automatic switching of outdoor column vacuum contactor
- Enterprise code

◆ Working conditions

3.1 Ambient air temperature: -40℃~+45℃.
3.2 Altitude: not higher than 2000m.
3.3 Sunshine: the amplitude (maximum) is 0.1w/cm².
3.4 Phoenix speed: not more than 35m/s.
3.5 Earthquake: intensity is not more than 8 degrees.
3.6 Installation site conditions: no severe mechanical vibration; no harmful gas and steam; no conductive or explosive dust。
3.7Pollution level: Ⅳ.
Note: Plateau and special environmental products are separately agreed.

Main technical parameters

Model	Rated voltage (kV)	Rated voltage of capacitor bank(kV)	Rated capacity (kvar)	Rated current (A)	Capacitor deviation	Allowable steady state overvoltage	Allowable steady state overcurrent	Model of shunt capacitor

Note: the above table only lists the common compensation capacity. Our company can manufacture various products with special capacity according to different needs of users.

Performance introduction

5.1 Capacitance deviation

5.1.1 The difference between the actual capacitance and the rated capacitance of the device is within the range of 0～+5% of the rated capacitance.

5.1.2 The ratio of the maximum to the minimum capacitance between any two line terminals of the device shall not exceed 1.02.

5.2 Insulation level

Rated voltage of device	1min power frequency withstand voltage of primary circuit (root-mean-square value)	Impulse withstand voltage of primary circuit [(1.2-5)/ 50 μ s peak value]	1min power frequency withstand voltage of secondary circuit (root-mean-square value)
6	32	60	2
10	43	75	2

5.3 Withstand short circuit current capacity

Main circuit electrical equipment and the withstand short circuit current of conductor is 12.5kA, 2S.

5.4 Overload capacity

5.4.1 Steady state overvoltage

Power frequency overvoltage Un	Maximum duration	Explanation
1.10	Long-term	It refers to the maximum value of long-term overvoltage not exceeding 1.10un
1.15	30 minutes in every 24 hours	Adjustment and fluctuation of system voltage
1.20	5min	The voltage increases under light load
1.30	1min	The voltage increases under light load

5.4.2 Steady-state over-current: can run for a long time when the root-mean-square value is not more than 1.1x1.3IN.

5.4.3 Maximum allowable capacity:

within the limits of 5.4.1 and 5.4.2, the total capacity shall not exceed 1.35QN.

5.5 Discharge performance:

10min after power off, the voltage on each group of capacitors is less than 50V.

5.6 Structure performance

5.6.1 The box body of the device is made of cold-rolled steel plate spray plastic or stainless steel plate shell, the structure of the device is beautiful in appearance, and there are distinct safety warning signs on the door. All kinds of electrical equipment are installed in the box, and the outdoor fittings, fasteners and cross poles are all treated by hot-dip galvanizing.

5.6.2 Minimum electrical clearance

Relevant position	Minimum electrical clearance of main circuit	Minimum electrical clearance of auxiliary circuit
Between electrified bare conductors of different phases(outdoor/indoor)	200 / 125	4
Between electrified bare conductor and grounding body(outdoor/indoor)	200 / 125	15
Between electrified bare conductor and ground	3000	-

5.6.3 Enclosure protection grade: IP33.

The box adopts good ventilation and heat dissipation design and has various protective functions, which is suitable for long-term outdoor operation.

5.7 Protection:

Protection of the device includes short circuit, over-current, over-voltage, under voltage, loss of voltage, phase loss protection, which preventing capacitor closing with charge. The pecific settings are as follows:

5.7.1 Short circuit between main circuit: drop fuse action to cut off fault phase. Switch acts on tripping, exits operation and locks itself.

5.7.2 Short circuit of capacitor bank to neutral point: slightly time limit acts on tripping and locks automatically. Setting value: 3In.

5.7.3 Over current of capacitor bank: act on tripping with time limit (delay 5S) and self locking. Setting value: 1.4～1.5In.

5.7.4 System overvoltage: act on tripping with time limit (delay 20～30S). Setting value: 1.1～1.3un.

5.7.5 Lightning strike and switching overvoltage: the protection is realized by zinc oxide arrester.

5.7.6 Under voltage: delay 0.2-0.5S to act on tripping. Setting value: 0.6Un.

5.7.7 Voltage loss: acts on tripping.

5.7.8 Phase loss: any phase breaking is operated by tripping and locking automatically.

5.7.9 Prevent capacitor closing with charge (10 min discharge protection): delay 10 min before putting capacitor bank into operation.

Note: the device can also set other protection functions according to the special requirements of users.

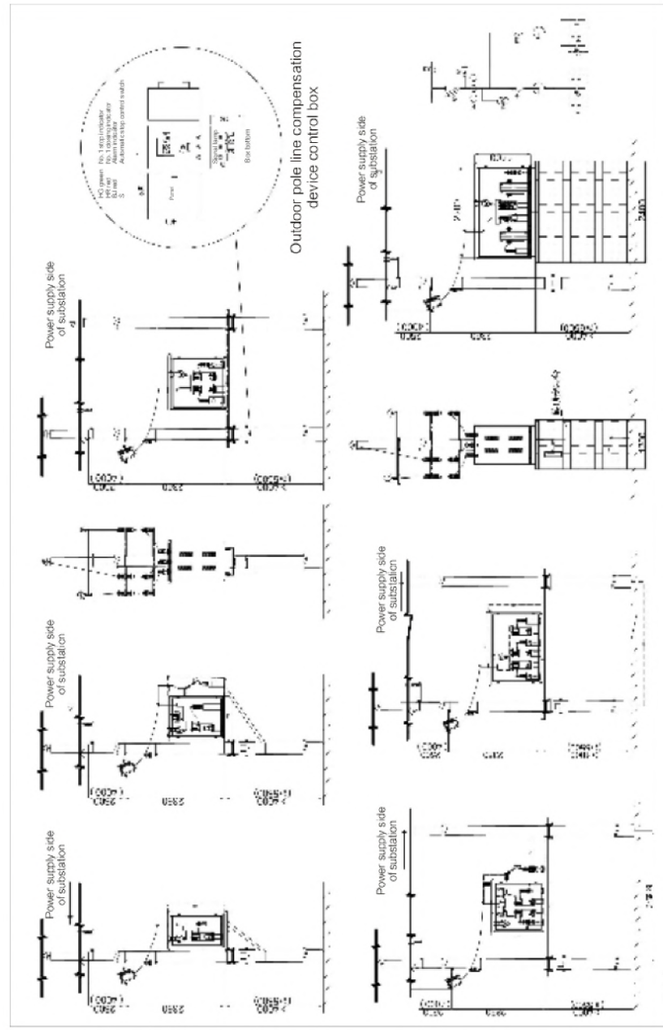
Overall dimension of box (L×W×H)mm	900×900×1350	900×900×1350	1350×900×1350	1350×900×1350	1800/2000×900×1350

Note: the box dimensions listed in this table are generally only applicable to devices with capacity of each capacitor bank not exceeding 300kvar. If the capacity of a single group exceeds 300kvar, the box size shall be designed according to the actual capacity.

Explain: the general installation method of scheme No. 01 and 02 is single pole installation, and scheme 03, 04 and 05 is double pole installation.

Installation diagram



Ordering instructions

Please provide the following information when ordering:

8.1 model and specification of the product, the number of groups and capacity of each group shall be indicated in detail according to the primary circuit scheme;
8.2 electrical components and parameters with special requirements;
8.3 transformation ratio of outdoor open current transformer;
8.4 material of device box shell (cold rolled steel plate, plastic spraying, stainless steel plate);
8.5 pole specifications (length and tip diameter);
8.6 name and quantity of spare parts and spare parts;
8.7 delivery time and mode of transportation;
8.8 other special requirements.

ZRTBKV

High voltage step voltage regulating reactive power compensation complete set device

◆ General

The product is mainly suitable for 6kV–220kV voltage level substations at all levels, installed on the 6kV/10kV/35kV bus of the substation. Products are widely used in power system, metallurgy, coal, petrochemical and other industries to improve voltage quality, improve power factor and reduce line loss.

◆ Model and meaning

ZR TB KV– □ – □ / □□ – □ / □

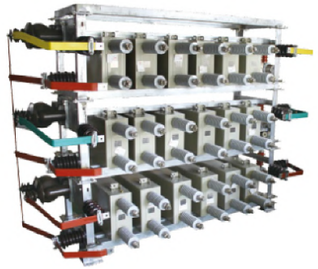
- Reactance rate of series reactor
- Single star connection/differential protection
- Double star connection/Neutral line unbalanced current protection
- Single star connection/open delta voltage protection
- Capacity of single capacitor (kvar)
- Installed capacity (kvar)
- Voltage regulation
- Complete set of shunt capacitor
- Enterprise code

◆ Working conditions

3.1 Ambient temperature: –20℃～+45℃.
3.2 Relative humidity: ≤90%(25℃).
3.3 Altitude: ≤1000m.
3.4 Seismic intensity: ground horizontal acceleration 0.25g, vertical acceleration 0.125g.
3.5 Installation location: indoor or outdoor, the horizontal plane of the installation site shall be inclined to the vertical plane no more than 5 degrees, and the installation and operation site shall be free from severe mechanical vibration, harmful gas and steam, and conductive or explosive dust.

◆ Device principle

The ZRTBKV substation voltage and reactive power automatic regulating device adopts the capacitor fixed access without grouping, and changes the compensation capacity of the capacitor by changing the voltage at both ends of the capacitor. According to the Q=2πfCU, the voltage and the C value of the capacitor remain unchanged, and the output of reactive power is changed by changing the voltage at both ends of the capacitor. Its output capacity can change the accuracy and depth of voltage regulation at (100%, 25%) × Q, that is, the regulation accuracy and depth of capacitors can be changed.



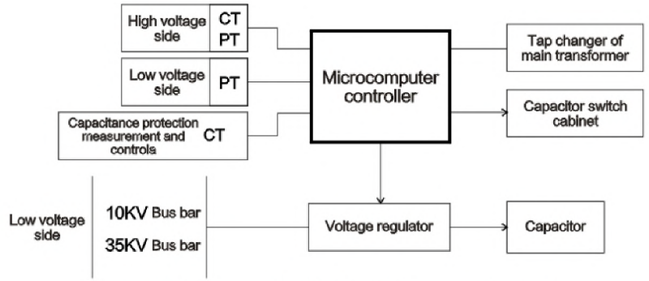


Fig.1 Working principle block diagram of the device

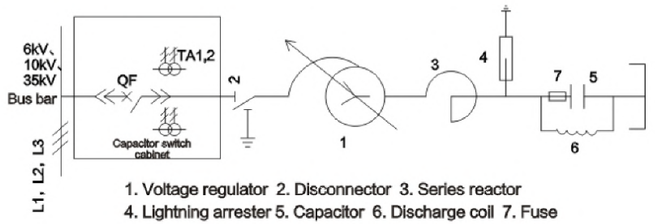
◆ Device composition

The voltage regulating automatic compensation device is mainly composed of three parts, namely, the voltage regulator, the complete set of capacitors and the voltage and reactive power control screen. Figure 2 shows the primary schematic diagram of the device:



1. Voltage regulator 2. Disconnector 3. Series reactor
4. Lightning arrester 5. Capacitor 6. Discharge coil 7. Fuse

Fig.2 Installation wiring schematic diagram

Voltage regulator: the regulator connects the capacitor and the bus. On the premise of ensuring the stability of the bus voltage, the output voltage of the capacitor is changed to ensure that the output capacity of the capacitor meets the requirements of the system.

Voltage and reactive power control screen: make tap judgment and issue commands according to the input current and voltage signals. Adjust the main transformer tap–changer of the substation to adjust the voltage to ensure the qualified rate of bus voltage. Adjust the output voltage of the voltage regulator to change the reactive power output of the capacitor, with the corresponding display and signal function.

Capacitor complete set: capacitive reactive power source.

◆ Advantages of the device

6.1 Compared with the switching type, with only one group of capacitor banks fixed access, nine–tap output can be realized, and the compensation accuracy is high, which can meet the requirements of reactive power variation of the system;
6.2 The voltage regulation mode of on–load autotransformer voltage regulator is adopted, the regulation speed is fast, the real–time automatic regulation can be realized, and the compen–sation effect is remarkable;
6.3 Can be closed at low voltage, which greatly reduces the closing inrush current and effectively reduces the impact on the system and capacitors;
6.4 Compared with switching, it can ensure that the capacitor can operate below the rated voltage for a long time, and there is no overvoltage and inrush current, which greatly prolongs the service life of the capacitor;

6.5 The device has a high degree of automation and has perfect protection functions, digital communication and remote maintenance functions, which can meet the needs of unattended and maintenance-free;
6.6.The additional loss is small, which is only about 2% of the capacitor capacity, which is equivalent to 1/10 of the SVC loss;
6.7 Capacitors do not need to be switched in groups, which reduces the equipment such as switching switches and area covered, and saves the cost of capital construction investment;
6.8 The device does not produce harmonics and will not cause harmonic pollution to the system;
6.9 When there is a series reactor, it can ensure that the reactance rate of each tap position is constant.

◆ Main function

7.1 Control function
7.1.1 Not only can the comprehensive regulation of voltage and reactive power be realized when the conditions are available, but also the voltage regulation of the main transformer can be controlled separately when there is no compensation capacitor, or the voltage regulator can be adjusted separately when the main transformer does not have on-load voltage regulation, and the reactive power compensation capacity can be controlled;
7.1.2 The reactive power of the capacitor can be automatically adjusted according to the needs of the power system;
7.1.3 According to the real-time data of the system and the control strategy of the nine-zone diagram, the voltage regulator and the main transformer tap-changer are controlled in real time to realize the optimal cooperation between the main transformer tap-changer and reactive power compensation equipment.
7.2 Protection function
7.2.1 Quick break and over-current protection;
7.2.2 Overvoltage protection;
7.2.3 Under voltage protection;
7.2.4 Unbalanced current protection, including neutral line unbalanced current protection and bridge differential unbalanced current protection, can meet the protection requirements of different connection modes of 66kV and below;
7.2.5 Unbalanced voltage protection, including unbalanced voltage protection and differential voltage protection between different sections in the same phase, is generally used for capacitor bank protection of 35kV voltage level;
7.2.6 The non-electric protection adopted for the voltage regulator body mainly includes light and heavy gas protection, temperature monitoring and pressure release protection;
7.2.7 Non-electric protection for on-load tap-changer, mainly includes on-load light and heavy gas protection;
7.3 Parameter setting and display function
7.3.1 It has on-site parameter setting function for personnel on duty, and all contents can be saved for more than ten years;
7.3.2 The voltage, current, power factor, reactive power, active power and voltage at low voltage side of main transformer can be displayed respectively;
7.3.3 Display microcomputer control mode, main transformer operation mode, tap changer gear of main transformer and voltage regulator;
7.3.4 Display various action information, and display the on-off status of corresponding high-voltage circuit breaker;
7.4 Locking function
7.4.1 The voltage on the low-voltage side of the main transformer can only be adjusted normally when the voltage is 80%～120% of the rated value; otherwise, the voltage of the main transformer will be automatically locked, and the lock will be automatically returned (that is, the locking state will be automatically released with the disappearance of the locking condition. Same as below);

7.4.2 If the number of actions per day of the controlled device reaches or exceeds the set value, the control of the device will be automatically locked, and the lock will be automatically returned at 0:00;
7.4.3 The main transformer differential, backup, weight gas, on-load weight gas action, etc., will lock up the control of the main transformer, and the lock will be released automatically with the disappearance of the locking condition;
7.4.4 Locking control of TV secondary circuit disconnection;
7.4.5 When the capacitor protection acts, the capacitor will be locked, and the locking will be automatically released with the disappearance of the locking condition;
7.4.6 When the capacitor is not in the closing position, the automatic regulation is not put into operation, and the allowable switching pressing plate is not put into operation, it will be locked;
7.4.7 Other remote signals that need to be locked.
7.5 Communication function
The device has a double RS-485 communication interface, which can communicate directly with the microcomputer blue control or protection management machine. The protocol adopts DL/T667-1999 (IEC-60870-5-103)or Modbus. The two software are optional, and the functions of telemetry, remote signal, remote control and remote adjustment can be realized comprehensively and reliably.

◆ Main technical parameters

8.1 Main parameters of voltage regulator
8.1.1 Rated voltage: 6.3kV, 10.5kV, 38.5kV
8.1.2 Capacity: 6.3kV(300-4000kvar), 10.5kV(300-7500kvar), 38.5kV(2000-25000kvar)
8.1.3 Output voltage: Ue-Ue×(0-8)×6.25%
8.1.4 Reactive power output of adjustable capacitor: Qce * (100-25%)
8.1.5 Voltage regulation mode: on-load voltage regulation, according to the requirement of guaranteed voltage output, the principle of minimum load loss of transformer, and the manu-facturing level of domestic on-load tap-changer, select appropriate on-load tap-changer, and end voltage regulation can be adopted.
8.1.6 Group: y, a0
8.1.7 Loss: ≤1.2 ‰×capacitor capacity
8.1.8 Impedance: less than 2.0% (converted to electromagnetic capacity)
8.1.9 Pollution level: Ⅳ, the creepage distance of outgoing line bushing shall not be less than 31.5mm/kV.
8.1.10 Cooling mode: oil immersed self cooling
8.1.11 Transformer oil: 25#(or 45#) domestic oil
8.1.12 Temperature rise limit: according to the requirements of GB1094.2.
8.2 Main parameters of controller
8.2.1 Rated data
Rated power supply voltage: DC220V to DC110V(order indicated)
Rated AC data:
Phase voltage: 100/V
AC current: 5A
Rated frequency: 50 Hz
Thermal stability:
AC voltage circuit: long term operation 1.2un
AC current circuit: long term operation 2In
1s 40In
8.2.2 Device power consumption
AC voltage circuit: per phase no more than 1VA;
AC current circuit: per phase no more than 1VA;
Protection power supply circuit: no more than 12W in normal operation and 15W in protection action.

8.2.3 Measurement accuracy
The measurement error of each analog quantity shall not exceed ±0.2% of the rated value;
The power measurement error shall not exceed ±0.5% of the rated value;
Switch input voltage (DC220V/ 110V/24V), resolution no more than 2ms;
8.2.4 Node capacity
8.2.4.1 Outlet tripping and closing contact
In the DC inductive load circuit where the voltage is not more than 250V, the current is not more than 1A, and the time constant L/R is 5ms ±0.75ms, the contact opening capacity is 50W and the long-term allowable passing current is not more than 5A.
8.2.4.2 Exit signal and other contacts
In the DC inductive load circuit where the voltage is not more than 250V, the current is not more than 0.5A, and the time constant L/R is 5ms ±0.75ms, the contact opening capacity is 20W and the long-term allowable passing current is not more than 3A.

10.1 Users can order according to the model, capacity, specification and quantity provided by our company, and also can provide parameters and requirements to be designed and determined by our company.
10.2 If the user only orders the regulation part and does not attach the capacitor, the user must provide the installation drawing of the original capacitor bank in the substation. Our company will help the user to provide the installation mode according to the installation condition of the original capacitor.
10.3 Order quantity, delivery time, delivery method, transportation mode, etc.
10.4 Other technical requirements.

ZRTSC

High voltage dynamic reactive power compensation complete set device

◆ General

The high voltage ZRTSC SVC dynamic reactive power compensation device adopts a full digital intelligent control system and uses high power thyristors in series to form a high voltage AC contactless switch, which can realize fast zero-crossing switching of multi-stage capacitor banks. The response time of the high voltage ZRTSC dynamic reactive power compensation device is less than 20ms. It can real-time monitor and dynamically compensate the impulse load and time-varying load, achieving the purpose of power factor compensation to more than 0.95; at the same time, the product absorbs foreign advanced technology, overcomes the shortcomings of the existing compensation methods, such as complex voltage regulation, easy impact of control switch, short service life and so on, and has the dual functions of dynamic compensation reactive power compensation and stabilizing system voltage, with the technical level is in the lead in China. Besides, the product has the remarkable characteristics of reducing network loss, saving electric energy and improving the quality of power supply, which can bring huge economic and social benefits to users.

◆ Working principle

The high voltage ZRTSC dynamic reactive power compensation device is composed of optical fiber trigger control system, valve control system, reactor, capacitor, protection element and so on. The control system is real-time monitored and intelligently adjusted by a microcomputer. The capacitor bank is switched by the thyristor. When the reactive current detected by the controller exceeds the set value, it automatically judges the number of stages of the capacitor bank that needs to be put into operation. The controller outputs the trigger signal to the specified thyristor and makes it turn on and put the capacitor bank into operation.

When the reactive current value of the load is lower than the set value, the controller gives the control signal, and the trigger stops sending the trigger signal and withdraws the capacitor bank from working. The above working is carried out completely automatically to ensure that there is no impact, no inrush current and no transition process in switching capacitors.

◆ Technical features

3.1 Real-time tracking of load changes, dynamic compensation of reactive power, and improvement of system power factor;
3.2 The optical fiber trigger technology is adopted to realize the isolation of the primary system and the secondary system, solving the interference problem, and ensuring the synchronization and accuracy of the trigger pulse;
3.3 Imported thyristors are used to control the switching of capacitor banks to realize zero-crossing switching and improve the service life of the device;
3.4 During the switching process of the capacitor bank, there is no surge current, no operating overvoltage, and no arc reignition phenomenon;
3.5 Dynamically restrain system harmonics. In order to improve the voltage distortion factor, the amplification of harmonic current by the capacitor bank is fully considered in the main circuit design to ensure the safe operation and reliable operation of the device.

◆ Technical parameters

4.1 System nominal voltage: 6kV, 10kV
4.2 Rated frequency: 50Hz
4.3 Dynamic response time: ⩽20ms
4.4 Input voltage of control power supply: 380V±5%
4.5 Phase number: 3 phases
4.6 Recommended values of capacitor bank module: 300, 600, 750, 900, 1000, 1200, 1500, 1800, 3000kvar
4.7 Capacitor connection mode: Y type
4.8 Recommended reactor reactance rate: 6%, 12%
4.9 Power factor: above 0.9 after compensation
4.10 Cabinet protection grade: IP20

ZRSVR

Series feeder automatic voltage regulator

◆ General

ZRSVR feeder automatic voltage regulator is a device that ensures the stability of output voltage by tracking the change of line voltage and automatically adjusting the body transformation ratio of the device. It can automatically adjust the input voltage in the range of 30%, and is especially suitable for lines with large voltage fluctuation or large voltage drop. This kind of voltage regulator is connected in series at the middle and back end of 6kV, 10kV and 35kV lines, and the line voltage is adjusted within a certain range to ensure the stability of the user's power supply voltage and reduce the line loss of the line; in addition, the ZRSVR feeder automatic voltage regulator is also suitable for substations where the main transformer does not have the ability of voltage regulation. This kind of voltage regulator is connected in series in the transformer outlet side of the substation to ensure that the voltage on the outlet side is qualified.

At present, the main countermeasures are as follows:

(1) New substation;

(2) Adjust the main transformer tap-changer of the substation to change the system voltage;

(3) Rational distribution of reactive power compensation device in the system to improve the reactive power flow distribution of the power grid;

(4) Change the line parameters according to the purpose of voltage regulation, and select the conductor cross-sectional area according to the tolerant voltage loss;

(5) Increase the number of outbound lines of the substation to disperse the load of the original line.

The disadvantages of the above methods are as follows:

(1) New substation---long construction period, huge investment and slow efficiency;

The adjustment of the main transformer tap-changer of the substation is mainly based on the bus voltage of the substation, limiting the bus voltage within a certain range to meet the requirements of voltage deviation within the radius, but can not meet the voltage requirements at the end of the long-distance power supply line. The substation bus will have multiple outgoing lines, and the load curves of each outlet are different, and the voltage drop is also different, which can not guarantee that the voltages of all lines can meet the requirements. Therefore, the flexibility and pertinence of this voltage regulation method is poor, when facing complex line, the voltage near the substation is high and the voltage far away from the substation is low.

(2) Capacitor compensation is mainly to improve the power factor of the line, but with limited effect of voltage regulation. Capacitor compensation alone can not solve the problem of voltage reduction caused by long line, fine wire diameter and resistance.

(3) Increase wire cross-sections and new lines, etc.---Long investment cycle and slow effect.

◆ Working principle

ZRSVR line automatic voltage regulator consists of three parts: autotransformer, on-load tap-changer and automatic controller.

The whole coil of autotransformer is divided into three parts: series excitation coil, shunt excitation coil and control coil. Among them, the series excitation coil is a winding with multiple taps, which are connected in series between the input and output through different contacts of the on-load tap-changer to change the tap position so as to change the transformation ratio of the autotransformer and achieve the purpose of adjusting the voltage; the shunt excitation coil is the common winding of the autotransformer, which produces a magnetic field that transmits energy; the control coil provides the controller with working power supply and sampling signals.

◆ Technical features

3.1 The autotransformer structure is adopted to realize on load automatic voltage regulation within ± 30%;

3.2 It has excellent control performance and communication function, and realizes the "four remote" functions of telemetry, remote signaling, remote control and remote control;

3.3 Special anti-interference measures are adopted to ensure the normal operation of the controller;

3.4 The controller is equipped with high and low gear limit protection to prevent the tap changer from jamming;

3.5 The oil tank of on load tap changer is isolated from the tank of autotransformer body;

3.6 Small volume, large capacity, light weight, low loss, easy to install;

3.7 It has significant effect of reducing consumption and energy saving;

3.8 High cost performance and high reliability.

◆ Technical parameters

4.1 Operating environment

4.1.1 The altitude is below 2000m;

4.1.2 Ambient temperature: maximum temperature +40℃, minimum temperature: −25℃;

4.1.3 Outdoor wind speed shall not exceed 35m/s;

4.1.4 Pollution level: Grade II;

4.1.5 The horizontal acceleration is not more than 3m/s², the vertical acceleration is not more than 1.5m/s², and the safety factor is greater than 1.67;

4.2 Autotransformer

4.2.1 Rated voltage: 10kV, 6kV, 35kV;

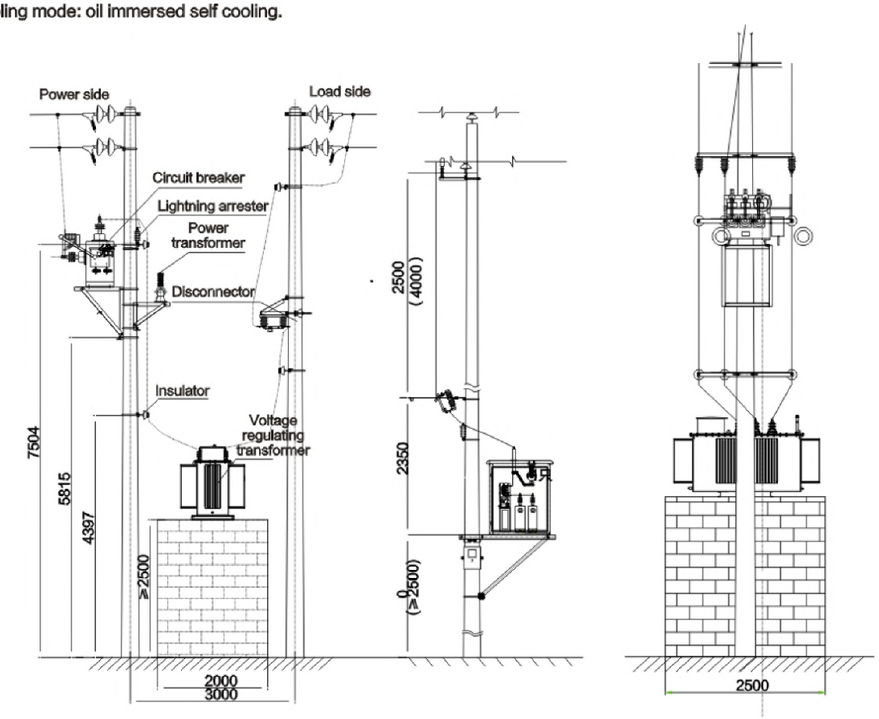
4.2.2 Rated capacity: 500～5000KVA (6kV), 315～12500KVA(10kV), 500～24000KVA(35kV)

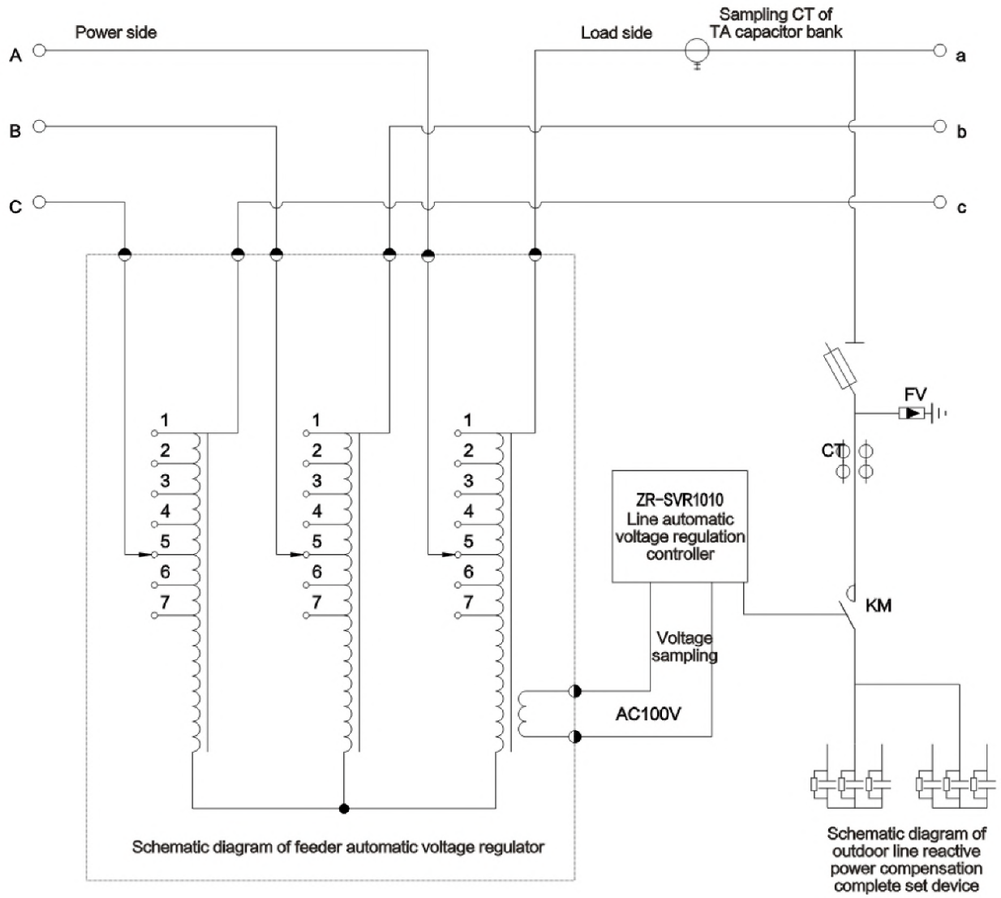
4.2.3 Rated frequency: 50Hz;

4.2.4 Wiring mode: three phase three wire single winding star connection;

4.2.5 Tapping stage: 7 or 9;

4.2.6 Cooling mode: oil immersed self cooling.





Schematic diagram of feeder automatic voltage regulator

GGJ

Low-voltage reactive power intelligent compensation device

◆ General

GGJ low-voltage reactive power compensation device using computer-aided design (CAD), the introduction of microcomputer control, intelligent implementation of intelligent tracking compen-sation, its reasonable structure, advanced technology, widely used in low-voltage power grid, improve power factor, reduce reactive power loss, improve power supply quality, is a new gener-ation of energy-saving products. Dedicated to the 130~600KVA three-phase transformer reactive power compensation.

◆ Model and meaning

GGJ □ □ - 0.38 - □ - □

- W outdoors, indoor (not marked)
- Rated capacity (kvar)
- System rated voltage (kV)
- H mixed compensation, F phase compensation, three-phase compensation (not marked)
- D dynamic compensation, static (not marked)
- Reactive power compensation device

◆ Working conditions

3.1 Altitude: ≤2000m;
3.2 Ambient temperature: -20℃~+45℃;
3.3 Relative humidity: ≤90% at 20℃;
3.4 Installation environment: no harmful gases and steam, no conductive or explosive dust and serious mold.

◆ Main features

4.1 Intelligent controller control, full-featured. Reliable performance, automatic compensation; can increase the power factor t0 0.9 or more;
4.2 Real-time display power grid power factor, display range: lag (0.00-0.99), ahead (0.00-0.99);
4.3 With over-voltage, harmonic, over compensation, system failure, lack of phase, overload and other comprehensive protection;
4.4 Memory has been set parameters, the system will not lose the parameters after power failure, the grid back to normal, automatically enter the running state, no personnel on duty;
4.5 According to the grid load balance, to take the phase compensation or mixed compensation;
4.6 Anti-interference ability, can withstand the direct input from the grid amplitude of 2000V interference pulse, higher than the national professional standards.

◆ Main technical parameters

5.1 Rated voltage: 0.38–0.66kV;
5.2 Rated frequency: 50Hz;
5.3 Rated capacity: 1–600kvar;
5.4 Applicable voltage range: (0.85–1.1) times the rated voltage;
5.5 Maximum allowable current: 1.3 times the rated current;
5.6 Control circuit: 1–16 loop;
5.7 Switching time: 1–150S I times, adjustable;
5.8 Working mode: automatic, continuous operation.

◆ Distribution network detection function

6.1 Real–time measurement and the whole point of the record transformer low–voltage side of the three–phase voltage, current, frequency, active power, reactive power, power factor, active power, reactive power; voltage and current total distortion rate and 2–25 subharmonic content;
6.2 RS–232 and RS–485 interface, can be handheld computer data copy, but also through the remote communication function to achieve wireless meter reading, device testing, parameter settings and time measurement data and records data reading;
6.3 Data analysis function: the operation load data can be analyzed and processed, statistical query; comprehensive analysis of power supply quality, calculate the voltage pass rate, power supply load rate, reliability and maximum load rate; query power factor, active power and reactive power; draw each phase voltage, current, power factor curve; print comprehensive analysis and statistical reports.

HXGN26-12(F)

Package type ac metal enclosed loop switchgear

General

1.1 Electric ratings: rated voltage 12kV, 50Hz, rated current up to 630A.
1.2 Application: applicable in the power distribution systems, especially suitable for application in prefabricated substation to control and protect the electric system.
1.3 Standards: IEC60298

Model and meaning

H X G N 26 - F

- F — Combination electric equipments of load switch and fuse
- 26 — Rated voltage
- N — Design No.
- G — Indoor
- X — Fixed type
- H — Packaged type

Working conditions

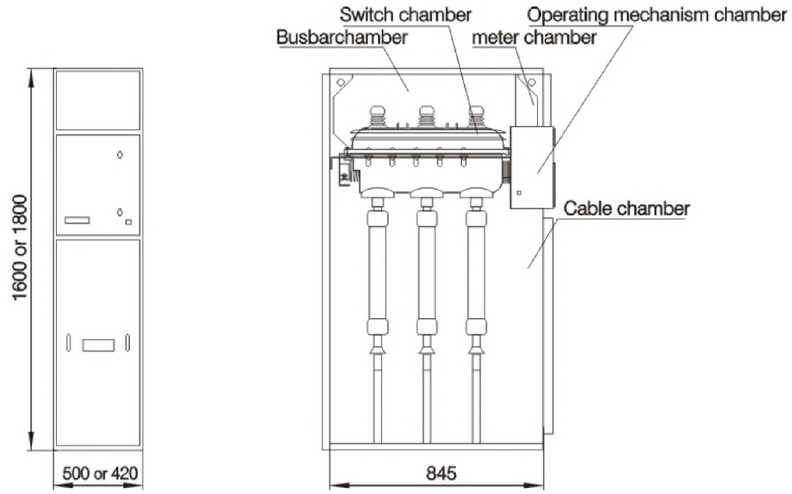
3.1 Ambient temperature: −15℃~+40℃;
3.2 Altitude: ≤1000m;
3.3 Humidity: daily average ≤95%, daily average of vapour pressure≤2.2kPa;
Monthly average≤90%, monthly average of vapour pressure ≤1.8kPa;
3.4 Earthquake intensity: ≤8;
3.5 Applicable in the places without corrosive and flammable gas.
Note: Customized products are available on your requirements.

Features

4.1 SF6 load switch with insulated enclosure FLN36−12D and FLRN36−12D could be matched in the switchgear.
4.2 Compact design and easy operation.
4.3 There is a pressure reliefing duct at the rear of the switchgear to protect the operator when a failure occurs in the switchgear.
4.4 Allocation of the switchgear is changeable.
4.5 Reliable interlocking at the different making status of the loading switch, earthing switch, to ensure the reliable operation.

Overall dimensions

Switchgear overall dimensions



GCS

Low voltage drawer switchgear

◆ General

LV drawer switchgear is suitable for distribution system of power plant, high building and some lines, such as petroleum chemistry and industry, metallurgy, textile, etc. It is applicable for distri –bution, motor centralized control, reactive power compensation in power generation and power supply system of three phase AC 50/60Hz, rated voltage 380V(400V,600V), rated current 4000A and below, where require high automation and interfaces with computers.

◆ Model and meaning

G C S - □ □

- Auxiliary circuit scheme No.
- Main circuit scheme No.
- Senyuan electrical system
- Drawable
- Enclosed switch

◆ Working conditions

3.1 Ambient temperature: −5℃~+40℃, daily average ⩽+35℃;
It should reduce capacity according to real condition when out of stipulation;
3.2 Indoor, Altitude ⩽2000m;
3.3 The change of ambient relative temperature will cause a little moist by accident;
3.4 The slant between device installation position and vertical section⩽5%;
3.5 Occasions without flammable and explosive matter, without corrosive chemical and frequent severe vibration.

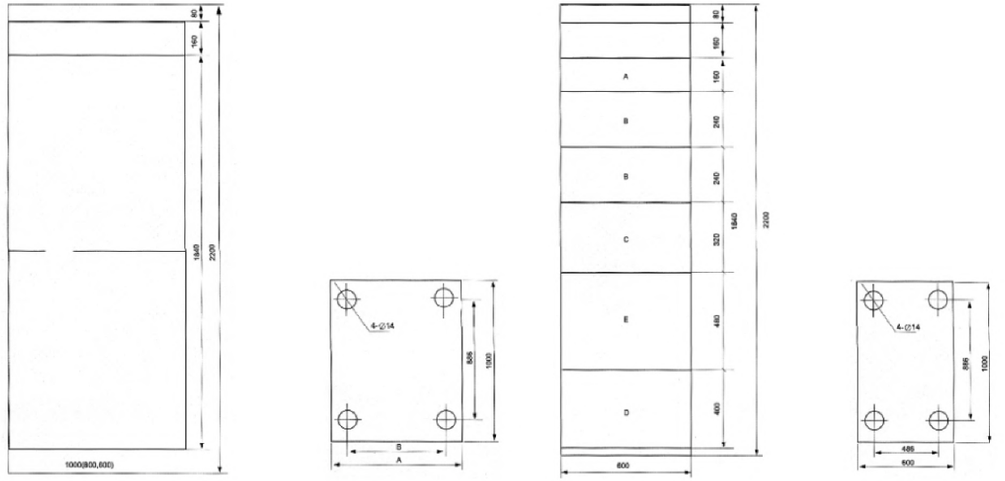
◆ Structural features

4.1 Main frame adopts 8MF open type steel which bended by 2.5mm cold rolled steel sheet. There are modulus with 20mm, 100mm, 9.2mm installation hole located on three side, high strength for modelling installation conveniently.
4.2 The drawer divided into 1/2 unit, 1 unit, 3 unit, loop rated current is 400A and blow.
4.3 Flexible assembly, compact structure, strong versatility, perfect secure performance, convenient assembly.
4.4 Improve heat capacity of patchboard, reduce additional temperature rise of plug in, cable terminal, isolating board due to temperature rise of transition element.
4.5 It can not influence other unit when any unit appears to fault between function unit and isolating unit, limit the emergency in a small scope.
4.6 Busbar horizontal is good for dynamic and heat stable performance.
4.7 The max 22 loops for MCC single panel, take consideration of requirement of auto motor door group about large unit capacity power plant, petroleum chemistry system line.
4.8 It finishes connection of device and outer cable in cable compartment, upper and down inlet and outlet is available. The zero sequence current transformer is installed in the cable isolating compartment.
4.9 It can limit short circuit current depend on limited reactor in the same power distribution system, to stabilize busbar voltage, reduce short circuit intensity requirement.

◆ Main technical parameters

Main circuit rated voltage (V)		AC 380(400),(600)
Auxiliary circuit rated voltage(V)		AC 220, 380,(400) DC 110, 220
Rated frequency (Hz)		50(60)
Rated insulation voltage (V)		660(1000)
Rated current (A)	Horizontal busbar	⩽4000
	Vertical busbar (mcc)	1000
Busbar rated short time withstand current (kA/1s)		50, 80
Busbar rated peak withstand current (kA/0.1s)		105, 176
P.F test voltage (V/min)	Main circuit	2500
	Auxiliary circuit	2500
Busbar	Three phase four wire	A.B.C.PEN
	Three phase five wire	A.B.C.PEN
Protection degree		IP40

◆ Overall dimensions



General panel	A	B	C	D	E	F×G
GCS−TG 1010−2	1000	1000	850	956	60	400×400
GCS−TG 0810−2	800	1000	650	956	160	400×400
GCS−TG 1008−2	1000	800	850	756	60	400×400
GCS−TG 0808−2	800	800	650	756	160	400×400

GCK

Low voltage drawer switchgear

General

GCK LV withdrawable switchgear to the low voltage distribution system with AC 50Hz, rated working voltage 380V. It contains power center (PC) and motor control center (MCC) functions. Each technical parameter all reaches national standards. With characteristics of advanced structure, beautiful appearance, high electric performance, high protection grade, reliable and safe and easy to maintain. It is the ideal distribution device for low voltage power supply system in metallurgy, petroleum, chemical, power, machinery and light weaving industries etc.

The product accords with standards IEC-439, GB7251.1.

Working conditions

2.1 Altitude above sea level should not exceed 2000m;
2.2 Ambient air temperature: -5℃~+40℃, and the average temperature: +35℃ in 24h;
2.3 Air condition: with clean air. Relative humidity should not exceed 50% at +40℃. Higher relative humidity is allowed at lower temperature. Ex. 90% at +20℃;
2.4 Places without fire, explosive danger, serious pollution, chemical corrosion and fierce vibration;
2.5 Installation gradient not exceed 5 degree;
2.6 Control center is suitable to the transportation and store with following temperature :-25℃~+55℃, in short time (within 24h) it should not exceed +70℃ .

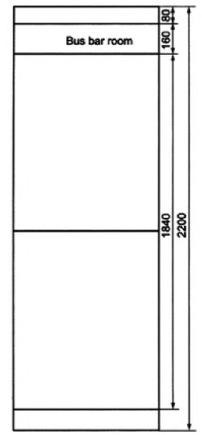
Main features

3.1 GCK1 and GCJ1 are assemble type combined structure. The basic skeleton is assembled by adopting special bar steel.
3.2 Cabinet skeleton, component dimension and starter size change according to basic modulus E=25mm.
3.3 In MCC project, parts in cabinet are divided into five zones (compartment): horizontal bus bar zone, vertical bus bar zone, function unit zone, cable compartment, and neutral earthing bus bar zone. Each zone is separated mutually for circuit's normal running and effectively preventing fault expansion.
3.4 As all structures of framework are connected and firmed by bolts, so it avoids the welding distortion and stress, and upgrades the precision.
3.5 Strong general performance, well applicability and high standardization degree for components.
3.6 Draw-out and insert of function unit (drawer) is lever operation, which is easy and reliable with rolling bearing.

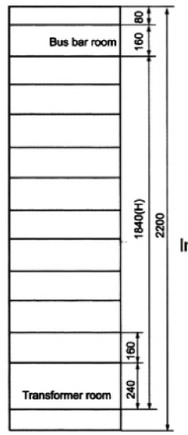
Main technical parameters

Item		Parameter
Protection grade		IP40, IP30
Rated working voltage		AC380
Frequency		50Hz
Rated insulation voltage		660V
Working conditions		
Environment		Indoors
Altitude		≤2000m
Ambient temperature		-5℃~+40℃
The min temperature under store and transportation		-30℃
Relative humidity		≤90%
Capacity of control motor(kW)		0.4~155
Rated current(A)		
Horizontal bus bar		1600, 2000, 3150
Vertical bus bar		630, 800
Contact connector of main circuit		200, 400
Feeding circuit		1600
Max current	PC Cabinet	630
Power receiving circuit	MCC Cabinet	1000, 1600, 2000, 2500, 3150
Rated short-time withstand current(kA)		
Effective value		50, 80
Peak value		105, 176
Power frequency withstand voltage(V/1min)		2500

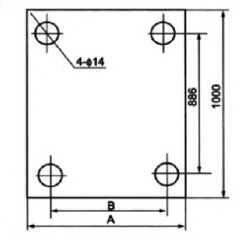
Internal structure



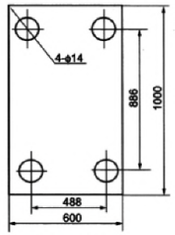
Incoming, busbar cabinet



Incoming, busbar cabinet



Incoming, busbar cabinet



Busbar cabinet

PC cabinet	2200×600(800、1000)×1000
MCC cabinet	2200× 600 ×1000
Height of drawer	160, 240, 320, 400, 480, 560, 640
Power receiving or feeding	600, 486
Power receiving or bus bar connection	800, 686
Power receiving or bus bar connection	1000, 886

Note: "H" of combined function unit of outlet cabinet is 1600. If not using public power, it will achieve 1840.

MNS

Withdrawable type low voltage drawer switchgear

◆ General

1.1 Electric ratings: rated voltage 690/1000V, rated current up to 5000A
1.2 Application:applicable in the low-voltage system of factories, etc, power distribution and motor control systems
1.3 Protection degree: IP30, IP40, IP54
1.4 Standards: IEC 60439

◆ Working conditions

2.1 Ambient temperature: -5℃~+40℃;
2.2 Altitude:≤2000m;
2.3 Relative humidity:≤50%, when the temperature is +40℃. Higher relative humidity for lower temperature e.g. 90% at +20℃;
2.4 Applicable in the places without danger of fire and explosion, chemical pollution, corrosive and flammable gas;
2.5 Pollution grade: 3;
2.6 Indoor installtion.

◆ Structural features

3.1 Frame
a. C type material adopted for the main frame. There are mounting holes with E=25mm on the main frame.
b. The switchgear is made of 2mm cold-rolled steel plate or zinc-coated plate.
3.2 Enclosure
The following functional plates could be installed for protection, as per your requirements
a.Front side: transparent glass door, normal plate, drawer plate and ventilation door
b.Rear side: the rear door, the screw fixed sealing plate
c.Lateral side: screw fixed lateral plate
d.Top: top plate with ventilation holes, outgoing rings or flange plate for top outgoing
e.Bottom: bottom plate
f.Inter-switchgears: complete clapboard adopted for the separation

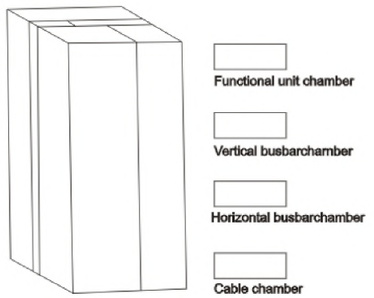
◆ Main technical parameters

4.1 Electric data
a. Rated insulation voltage 690/1000V
b. Rated operational voltage 400V/690V
c. Rated frequency: 50/60Hz
d. Rated impulse withstands voltage: 8kV
e. Rated voltage of auxiliary circuit: AC380/220V, DC110/220V
f. Over-voltage grade: Ⅲ
g. Rated current: ≤5000A
h. Rated current of horizontal busbar: ≤5000A
i. Rated current of vertical busbar:1000A
4.2 Mechanical items
a. Incoming and outgoing mode
b. Cable incoming and outgoing
c. Connection mode
d. The functional units completely separated or partially separated
4.3 Switchgear dimensions
a. Height (mm): 2200
b. Width (mm): 600, 800, 1000
c. Depth (mm): 600, 800, 1000
d. Surface processing
e. Surface color: 5Y8/1
4.4 Horizontal busbar
a. Rated short-time withstand current: 50/80/100kA
b. Rated peak withstand current: 105/176/220kA
4.5 Vertical busbar
a. Rated short-time withstand current:50kA
b. Rated peak withstand current:105kA
4.6 Earthing system: TT, IT, TN-S, TN-C-S

Note:
1. For the switchgear of IP54, the min depth is 728mm
2. For easier bus bar installation depths of the switchgears should be unified. If the depths are not unified, a busbar exchange switchgear with depth of 400mm should be added.
3 .The depth of the switchgear should be ⩾800mm, if there is incoming and outgoing of busbar bridge and channel .
4. Customized products are available.

◆ The internal allocation

There are four independent chambers inside the switchgear
4.1 Horizontal busbar chamber: the horizontal busbar is at the rear side of the switchgear for front side outgoing. The horizontal busbar could also be installed at the top.
4.2 Vertical busbar chamber :
L type busbar adopted for the vertical bus bar.
When the drawer units is drawed out, the protection degree of the electrified part is IP20.
4.3 Functional unit chamber:
In front of the upper cabinet or cabinet front left side.
4.4 Cable chamber: the chamber is at the night and the front side for front outgoing, at the right and the rear side for rear outgoing.



GGD

AC Low-voltage fixed type switchgear

◆ General

GGD AC LV fixed type switchgear is applicable to the distribution system with AC 50Hz, rated working voltage 380V, rated current to 3150A below in power station, substation, plant enterprise etc., used for power transfer, distribution and control for power, lighting and distribution devices.

The product has characteristics of high breaking capacity, fine dynamic and thermal stability, flexible electric project, convenient combination, better serial practicability, novel structure and high protection grade etc.

It accords with the standards IEC439 "Low voltage complete switch device and control device" and GB7251.1 "Low voltage complete switch device" etc.

◆ Working conditions

2.1 Ambient air temperature: −5℃ ~ +40℃ and the average temperature ≤ +35℃ in 24h.
2.2 Indoor installation and use. Altitude above sea level for operation site ≤ 2000m.
2.3 Relative humidity should not exceed 50% at max temperature +40℃. Higher relative humidity is allowed at lower temperature. Ex. 90% at +20℃. But in view of the temperature change, it is possible that moderate dews will produce casually.
2.4 Installation gradient not exceed 5 degree .
2.5 Install in the places without fierce vibration and shock and the sites insufficient to erode the electrical cents.
2.6 Any specific requirement, consult with manufactory.

◆ Main features

3.1 The body of GGD AC LV fixed type switchgear adopts universal cabinet type. Framework is assembled with 8MF cold bending bar steel through part welding. Framework components and special mating elements are matched by bar steel pointed manufactory for ensuring the precision and quality of cabinet. Components of universal cabinet is designed according to module principle, and with 20 modulus mounting hole and high universal coefficient.
3.2 Completely in view of the heat rejection during cabinet running. Heat rejection slots of different quantities are installed in upper and underside both ends of cabinet.
3.3 According to the requirements on mold design for modern industry products, adopting the method of golden mean ratio to design cabinet outline and parting dimensions of each part, to make the whole cabinet beautiful and decent.
3.4 Cabinet gate is connected with framework with rotation axis type movable hinge. With convenient installation and disassembly. One mount type rubber strip is set in edge fold of gate. Filler rod between gate and framework has certain compression stroke when closing the gate. It can prevent gate from impacting cabinet directly and also advance the protection grade for gate.
3.5 Connect the meter gate set with electrical components with framework by multistrand soft copper wire. Connect the mounting pieces inside the cabinet with framework by knurled screws. The whole cabinet constructs complete earthing protective circuit.
3.6 Top cover of cabinet can be disassembled if necessary for convenience to the assembly and adjustment for main bus bar at site. Four squares of cabinet are set with slinger for hoisting and shipping.
3.7 Protection grade of cabinet: IP30. User can choose within IP20 ~ IP40 according to environ −mental requirements.

HXGN15A-12(F-R)

Fixed type package type AC metal enclosed switchgear

◆ General

1.1 Electric ratings: rated voltage 3–10kV, rated current up to 630A for load break switchgear and 125A for combined switchgear, 50Hz.
1.2 Application: applicable for power distribution, control, and protection on electric equipments as the loop power supply unit or terminal equipment
1.3 Standards: IEC60420

◆ Model and meaning

H X G N 15A 12 (F•R)

- (F•R) — Combined load break switch and fuse
- 12 — Rated voltage
- 15A — Design No.
- N — Indoor
- G — Fixed type
- X — Packaged type
- H — Loop

◆ Working conditions

3.1 Ambient temperature: −25℃~+40℃
3.2 Altitude: ≤1000m
3.3 Humidity: daily average ≤95%, monthly average ≤90%
3.4 Earthquake intensity: ≤magnitude 8
3.5 Applicable in the places without corrosive and flammable gas
Note: Customized products are available on your requirements

◆ Features

4.1 8MF material adopted for the switchgear, modular holes available with E=20mm.
4.2 Switch disconnector, vacuum load break switch, earthing switch and the switchgear door reliably interlocked, which could avoid miss operation.
4.3 Both manual and automatic operation are available.
4.4 There is lead sealed pin at the door of measurement chamber and meter chamber.
4.5 Prompt tripping could be realized to protect the equipments.
4.6 The design facilitate the operation at the front panel and the switchgear could be installed along side the wall.
4.7 The switchgear is featured for its complete interlocking functions: the load break switch could be operated to the making status when the switchgear door is closed and locked and the earthing switch to the making position. The earthing switch could make or break when the load break switch is at disconnect position. When the earthing switch is at making status, input the insulation clapboard to its position, the switchgear door then, could be opened. The vacuum arc-extinguishing chamber and fuse are reliably connected. So as the fuse & switchgear door and insulation clapboard & the switchgear door.

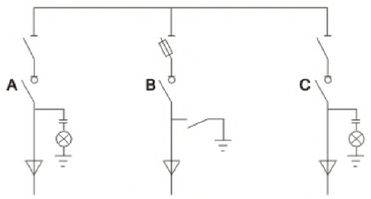
The diagram for loop power supply

The loop power supply is composed of three basic units to separate any one of the failure line and ensure the continuous power supply through the other unit. The branch line for the user could separated and protect the transformer which could facilitate the maintenance. The loop power supply could be expanded as per the user's requirements to form various protection plans.



Cable income and outlet switchgear Switchgear at the user's transformer branch circuit Cable income and outlet switchgear

KYN28A-12(Z)(original GZS1)

Withdrawable type metalclad AC enclosed switchgear

General

1.1 Electric ratings: rated voltage 3.6~12kV, 50Hz
1.2 Application: applicable in the system of three phase AC single busbar, double busbar and single busbar stand-by pass to receive and distribute the power.
1.3 Standards: IEC60298

Model and meaning

K Y N 28A 12 (Z)

- (Z) — Vacuum circuit breaker
- 12 — Rated voltage (kV)
- 28A — Design No.
- N — Indoor type
- Y — Removable withdrawable type
- K — Metalclad type

Working conditions

3.1 Ambient temperature: −10℃~+40℃;
3.2 Altitude: ≤1000m;
3.3 Humidity: Daily average ≤95%, Monthly average ≤90%;
3.4 Earthquake intensity: ≤magnitude 8;
3.5 Applicable in the places without corrosive and flammable gas.
Note: Customized products are available on your requirements.

Features

4.1 The switchgear is composed of panel body and middle-mounted removable part.
4.2 The panel body is divided into four separate compartments.
4.3 The switchgear has aerial inlet and outlet, cable inlet and outlet, and combination schemes.
4.4 The panel body connected with nuts and bolts having high strength adopts package assembly so as to facilitate production, short production period, have interchangeability of parts and save occupied area.

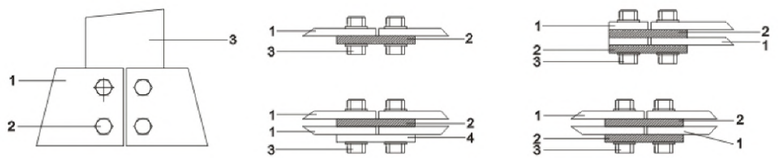
◆ The connecting method of the busbar and branch busbar



1. Main busbar
2. Branch busbar
3. Bolt
4. Pad

Draw–out circuit breaker room

In the separate room of the circuit breaker, open the metal valve to check the static contact.

Branch main busbar is connected with static contact box 6 and main busbar and not need any other support. For special requirements, the main busbar can equipped with pyrocondensation bushing, insulation bushing of connect bolts and top cover, main busbar in side cabinet will be fixed with bushing 3, thus ,when inner trouble arc appears, air preserved in it can protect it from melt. Furthermore, bushing 3 can effectively limit the trouble within the cabinet.

Cable separate room

The space of switchgear separate room is enlarged thank to its withdrawable model CT7 and earthing switch are installed on back wall of the zone, while arrester 10 is installed on the bottom of rear side. Move the handcart15 and withdrawable horizontal baffle plate 17 away, then operators can enter form bottom for erecting and maintain. Each phase of the cable connection conductor can connect with 1–3 single core cables at the same time, and if necessary, can even connect with 6 single core cables. The disassemble non–metatenvelop plate or unmagnetoconductive metal plat equipped on bottom of the cabinet ensure the convenience of the construction.

Relay instrument room

The relay instrument room can be used for erection of relay protection components, instruments, indicators and secondary equipments fulfilled with special requirements. The control circuitry is laid in slots with enough space, and covered with metal cover board, to separate the secondary wires from high voltage parts. The left slot is pre–set for inlet and outlet of the controlling cable, while the inner control cable of itself is laid on the right side. Besides, a hole exits on the cover board of this room, for the inlet and outlet of small bus cables, and in cable connection, the cover board of the room can overturn. All these make the construction more convenient.

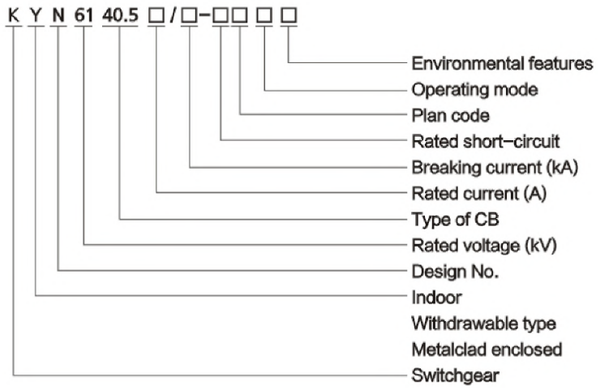
KYN61-40.5(Z)

Withdrawable type metalclad AC enclosed switchgear

General

1.1 Electric ratings: system voltage 40.5kV, rated current up to 2000A, AC50Hz.
1.2 Application: applicable for power receiving and distribution of power plant and substations for control, protection and measurement.
1.3 Standards: IEC 60298

Model and meaning



Working conditions

3.1 Ambient temperature: −15℃~+40℃;
3.2 Altitude: ≤1000m;
3.3 Humidity: daily average ≤95%, monthly average ≤90%;
3.4 Earthquake intensity: ≤magnitude 8;
3.5 Applicable in the places without corrosive and flammable gas.
Note: Customized products are available on your requirements.

YB□-12

European type substation

Composition

The covering material are: colored steel plate, cold rolled plate, stainless steel, glass-fabric special cement, aluminum alloy and copper aluminum zinc plate. The insulating medium of medium voltage switch device:SF6, atmosphere and vacuum. Transformer: oil and dry mode. Low voltage power device-main switch: universal breaker, intelligent breaker and outgoing switch. No flashover plastic switch, automatic reactive capacity, capacity with no touched point and connector can be throw in and throw out.

Model and meaning

YB □-12 0.4 □

- Transformer rated capacity (kVA)
- Low voltage side rated voltage (kV)
- High voltage side rated voltage (kV)
- Arrangement
- Pre-fabricated substation

Working conditions

3.1 Ambient temperature: -25℃~+40℃;
3.2 Altitude: ⩽1000m;
3.3 Wind pressure: ⩽700Pa;
3.4 Humidity: daily average ⩽95%, monthly average ⩽90%;
3.5 Pollution degree: Ⅳ;
3.6 Earthquake intensity:8 degree;
3.7 Occasions without fiercely shake and corrosiveness, as well as without flaming and explosive matter, the verticality is no more than 3 degree.

Product features

4.1 There are automatic temperature controlling device, exhaust blower, heating and dew against device in the substation.
4.2 Characteristic: Fastness, heat insulation, ventilation, good performance, guards against the micro-organsm, moisture proof, nice looking ,convenient maintenance, occupies little ground and so on.
4.3 At the high voltage side, use breaking switch and current limited fuse as the protector for the transformer. When the current limited fuse was fused, the three-phase load breaking switch will cut off. The high voltage side also can adopt the vacuum breaker as the protector.
4.4 At the bottom of the transformer, the pony truck can be installed, which can pass in and out freely for the inspection.
4.5 The wiring and arrangement are various; In terms of different environment and condition. It can adopt different structures and covering material.

Main technical parameters

No.	Item	Unit	High voltage unit	Transformer	Low voltage unit
1	Rated voltage	kV	12	12/0.4	0.4
2	Rated capacity	kVA		30-1600	
3	Rated current	A	630		100-2500

Nonmetal covering

Aluminum alloy covering

Colored steel plate covering

YB□-12

American type substation

Composition

The YB□ prefabricated substation is an important unit of the power supply network. It has the feature of controlling, protecting, power transforming and power distributing for high voltage. The high voltage load break switch and fuse are put into the transformer oil. So it has two kind structures that are: single and sharing substation with transformer. There are the oil thermo-meter, pressure gauge, pressure release valve, oil drain valve monitors in the fully sealing oil box. The way of power supply is ring main unit mode, terminal mode and bi-power mode. For the fact of the domestic power supply network, our company produces the insert type dry fuse, if the fuse fused, it won't affect to the transformer oil. There are three kind of YB□ substation: stand-ard model, strengthen model, integrated model.

Model and meaning

YB □-□ 0.4-□

- Rated capacity of transformer (kVA)
- Rated voltage of low voltage (kV)
- Rated voltage of high voltage side (kV)
- Design No.
- Prefabricated substation

Working conditions

3.1 Ambient temperature: −10℃~+40℃
3.2 Altitude: ≤1000m;
3.3 Wind speed: 34m/s(Wind pressure: ≤700Pa);
3.4 Humidity: Daily average ≤95%, monthly average ≤90%;
3.5 Shake-proof: Level acceleration ≤0.4m/s, and the vertical acceldration ≤0.15m/s;
3.6 Gradient of installation place: ≤3 degree;
3.7 Occasions without fiercely shake and corrosiveness, as well as without flaming and explosive matter.
3.8 If you have other requirement not on the list, warmly welcome to contact us.

Product features

4.1 Compact structure, the volume is the same as 1/3~1/5 of European substation;
4.2 Full sealing and fully insulated, needn't insulated gap;
4.3 The wiring management can be used in the ring main unit and terminal;
4.4 Low wastage, noise and temperature rise;
4.5 It has the strong capability of anti over load, short circuit and impulse;
4.6 Conforms to the various requirements of low voltage outgoing;
4.7 There are two kinds of cable, 200A elbow plug and 600A "T" the stationary electric cable, which can match to the fully sealing device;
4.8 Zinc oxides arresters, 200A electric with load insert which can be used as disconnecting switch.

SRM-12

Fully insulated, fully sealed and inflatable ring network switchgear

◆ General

SRM–12 fully insulated, fully sealed and inflatable ring network switchgear has passed the type test of the National High Voltage Electrical Apparatus Test Center. Products are widely used in 12kV/6.3kV distribution systems, and are the preferred switch products for all kinds of urban and rural users' power transformation and distribution systems.

Switch cabinet is modular unit mode, which can be combined according to different purposes; It consists of fixed unit combination and expandable unit, and meets the needs of flexible use of compact switchgear in various substations.

SRM–12 fully insulated, fully sealed and inflatable ring network switchgear is a fully sealed system, and its live components and switches are enclosed in a stainless steel body. The whole switch device is not affected by external environmental conditions, thus ensuring operation reliability and personal safety, and maintenance–free. By selecting extensible bus, any combination can be realized and full modularization can be achieved. Expand bus safety insulation and shield –ing to ensure reliability and safety. SRM–12 fully insulated, fully sealed and inflatable ring network switchgear can provide TV–based automation solutions at the same time, forming the concept of intelligent switch, and minimizing the workload of field installation and debugging.

SRM–12 fully insulated, fully sealed and inflatable ring network switchgear is divided into non–expandable and expandable standard configuration. Because of the combination of full module and half module and the self–extensibility, it has very special flexibility.

SRM–12 fully insulated, fully sealed and inflatable ring network switchgear implements GB standard. It has a design life of more than 30 years under indoor conditions (20℃). With the increasing demand, the market relationship between short supply and demand is gradually presented. Therefore, this system has broad market prospects.

◆ Unit definition

Unit code	Meaning
C	Standard single bushing load switch unit
F	Load switch–fuse combination electrical unit
V	Circuit breaker unit
D	Cable inlet unit (without switch)
+	Busbar side bushing
–	Bus top sleeve
SL	Bus connection unit
M	Measurement unit
PT	PT unit
1K2(4)	Load switch unit with double bushing outgoing line

Main technical parameters

XGN-12

Intelligent solid insulation cabinet

General

XGN-12 Series Solid fully insulated and fully sealed ring network switchgear is a kind of solid insulated vacuum switchgear which is fully insulated, fully sealed and maintenance-free. All high-voltage live parts are cast with epoxy resin with excellent insulation performance, and the vacuum interrupter, main electrical circuit and insulation support are organically combined into a whole, and the functional units are connected by fully insulated solid bus. Therefore, the whole switch equipment is not affected by the external environment, which can ensure the reliability of equip-ment operation and the safety of operators.

The ring network cabinet has the characteristics of simple structure, flexible operation, reliable interlocking, convenient installation, etc. It is suitable for 50Hz and 12kV power systems, widely used in industrial and civil cable ring network and distribution network terminal projects, as the use of electric energy acceptance and distribution, especially suitable for urban residential distribution, small substations, switching stations, cable branch boxes, box-type substations, industrial and mining enterprises, shopping malls, airports, subways, wind power generation, hospitals, stadiums, railways, tunnels and other places.

Because the product has the advantages of full insulation, full sealing and full shielding, it is especially suitable for high altitude, high temperature, damp heat, severe cold, serious pollution and other harsh environmental areas.

Model and meaning

X G N □ - 12 / □ - □

- Rated breaking short-circuit current (kA)

- Solid insulation

Product classification

According to switch types, it can be divided into load switch with grounding assembly (referred to as C module), load switch without grounding assembly (referred to as CB module), circuit breaker with grounding assembly (referred to as V module), circuit breaker without grounding assembly (referred to as VB module), circuit breaker switch (referred to as VZ module), load switch + fuse combination electrical switch assembly (referred to as F module) and isolating switch assembly (referred to as G module).

Working conditions

4.1 Environmental temperature: -45℃~+45℃;
4.2 Humidity: Maximum average relative humidity, daily average ≤95%, monthly average ≤90%;
4.3 Altitude: ≤ 4000 meters;
4.4 Seismic resistance: 8 degrees;
4.5 Protection level: charged body sealing IP67, fuse cartridge IP67, switchgear shell IP3X.

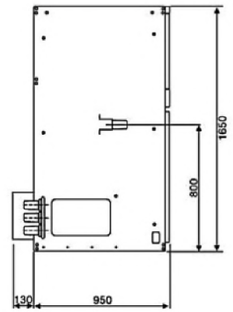
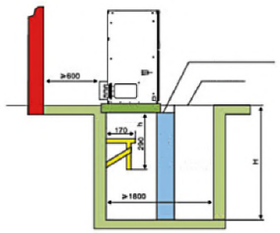
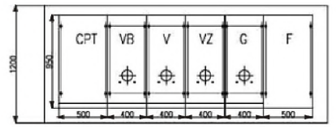
PT cabinet | Circuit breaker cabinet | Circuit breaker cabinet | Circuit breaker busbar cabinet | Bus lifting cabinet | Load switch fuse combination cabinet







Note:

1. The bottom of concrete cushion should be compacted with plain soil;
2. No pillars can be added if the total length of the switch cabinet does not exceed 2m, but when the total length of the switch cabinet exceeds 2m, one pillar should be added every 2m span;
3. In the figure, the space ≥ 600 behind the cabinet is the pressure relief channel of the switch cabinet, so the switch cabinet is a group, and the two ends behind the cabinet need to be added with protective barriers;
4. H in the figure depends on the maximum cable bending radius.

XGN-12

Intelligent solid insulation cabinet and accessories

◆ Service environmental conditions

1.1 Suitable for indoor or outdoor;
1.2 Surrounding air temperature: indoor −10℃～+25℃, outdoor −60℃～+60℃;
1.3 Relative air temperature: daily average not exceeding 95%, monthly average not exceeding 90%;
1.4 Altitude not exceeding 3000m;
1.5 The surrounding air should not be significantly polluted by dust, water vapor, salt mist, corrosive gases, or combustible gases;
1.6 Outdoor type can be used in harsh environmental conditions;
1.7 There is no severe vibration at the installation site, and the seismic intensity does not exceed 8 degrees.
1.8 When the above environmental conditions cannot meet the usage requirements, the user shall negotiate with the manufacturer.

◆ Model and meaning

GN SIS - 12 / T(D) 630 - 25

- 25 — Rated short time withstand current (kA)

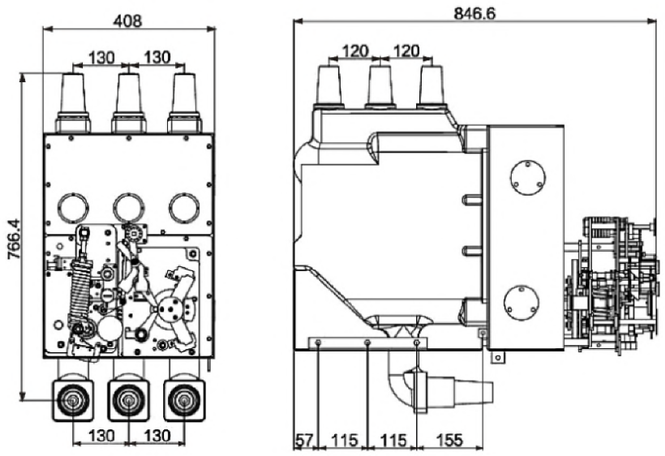
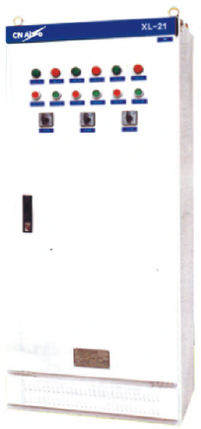
- 12 — Rated voltage (kV)
- SIS — Solid insulation movement
- GN — Enterprise code

◆ Overall and installation dimensions



XL-21

Power distribution cabinet



◆ General

XL−21 type low voltage power distribution cabinet is applicable to power station and industrial and mining enterprise, used for power distribution in three−phase four−wire or three−phase five−wire system with AC 500V and below. It is installed indoors and near the wall. Repair before shield. Shell is bent with steel plate. Knife switch operation handle is installed to the upside of right column of cabinet front, can be used for switching power. Choose different types and circuit breakers with different current grades to user's specific requirements.

◆ Model and meaning

ATS

Dual power distribution cabinet

◆ General

ATS dual power distribution box is suitable for three-phase three-wire, three-phase four-wire, three-phase five-wire system with AC voltage below 500V in power plants and industrial and mining enterprises, for power lighting distribution. ATS dual power distribution box is for indoor use, which is installed against wall, and available to maintain in front of a screen.

◆ Model and meaning

ATS - □ - □

- Main circuit scheme number
- Design No.
- Dual power distribution cabinet

◆ Working conditions

3.1 Temperature range: -50℃ to +40℃, and average temperature within 24h≤+ 36℃;
3.2 Altitude: ≤ 2500m;
3.3 Ambient humidity: humidity ≤50% in surrounding air temperature of + 40℃; in surrounding of lower temperature, allows higher relative humidity (such as: + 20℃ at 90%), considering moderate coagulate frost happens when temperature change;
3.4 Ground inclination no more than 5 degrees, in circumstance without violent vibration, shock and corrosion.

Note: if special adverse conditions are involved, please consult the company.

◆ Product structure

Floor-standing dual power distribution cabinet is a power distribution device installed indoors against the wall and of front opening door. Its basic structure is composed of bending sheet metal and welding angle steel. The front right side can be equipped with a knife switch operation handle to control power supply. The box door can be equipped with operation buttons, indicator lights and display instruments, the internal equipment of the distribution box is all open, easy to maintain and repair. The distribution box is equipped with air circuit breaker, fuse protector, contactor, and thermal relay. The door and housing are welded with grounding screws to ensure a reliable connection between the housing and the ground.

◆ Main technical parameters

Item	Unit	Parameter
Main circuit rated voltage	V	AC380
Auxiliary circuit rated voltage	V	AC220, AC380
Rate frequency	Hz	50
Rated insulation voltage	V	660
Rated current	A	≤800A

MG

Motor soft start cabinet

◆ General

MG digital soft starter is the high and new technology product designed and manufactured by our company for users. It has features of simple structure, easy operation, secure and reliable, complete functions, small starting current, small, energy-saving and long-life. It overcomes the defects brought by traditional Y-△ start, self-coupling transformer start and resistance step-down start, such as high impulse current and impulse from torque. It is the ideal changing generation product for traditional starter by overcoming the defects of big, complex circuits, high power consumption and high maintenance rate etc.

GZDW

DC power screen

General

This new generation of microcomputer controlled direct-current power supply panel GZDW /GZTW series adopts integrated module structure, is mainly composed of monitoring module, rectifier module, insulated monitoring module, battery inspection module, AC/DCmonitoring module, switching value monitoring module, step-down module, distribution unit, storage battery and cabinet body, is featured with flexible configuration, stable performance, friendly interface, simple operation, intellectualized management, etc. The products are widely applied to various power plants, transformer substations, mobile communication station, industrial and mining enterprises, electrified railways, airports, havens, high-rise buildings, residential areas, etc, also can be used as operating and control source of high-voltage switch, electromechanical protection, automatic device, communication equipment, SPC exchange, electric carrier and other equipment.

Model and meaning

G Z □ W – □ □ – □ – □ – □

- Battery type
- Rated output voltage (DC): 220V, 110V, 48V, 24V
- Battery capacity (Ah), dual battery pack×2
- Installation mode: A-floor type, B-wall-mounted type
- Monitoring type: 1. HZ-JK01; 2. HZ-JK02; 3. HZ-JK03; 4. HZ-JK04
- Microcomputer control type
- Application for: D. electric power systems, T. communication systems
- Direct-current power supply
- Panel (cabinet)

Industry standard

3.1 DL/T459-2000 Specifications of D.C supply cabinet in power system
3.2 DL/T637-1997 Specification for order of the valve regulated sealed lead-acid batteries
3.3 DL/T724-2000 Specification of operation and maintenance of battery DC power supply equipment for electric power system
3.4 DL/T781-2001 High frequency switching converter module in power system
3.5 DL/T856-2004 DC electrical source supervisor for electric power
3.6 DL/T857-2004 Specification of rectification inversion equipment for battery of power plant and substation
3.7 DL/T5044-2004 Technical code for designing DC system of power projects
3.8 DL/T5120-2000 DC System design code for small electric power project

Scope of application

This microcomputer controlled direct-current power supply panel GZDW is an integrated power supply panel especially designed for users of different capacity. The system is mainly composed of monitoring module, rectifier module, AC/DC monitoring module, insulated monitoring module, battery inspection module, switching value monitoring module, step-down module, is featured with stable performance, friendly interface, simple operation, intellectualized management, etc. The products are applicable to transformer substations of different voltage class, power plants, industrial and mining enterprises, electrified railways, high-rise buildings, etc, also can be used as operating and control source of high-voltage switch, relay protection and automatic device.

Main technical parameters

Item	Parameter
Rated input voltage	380VAC±20%　220VAC±20%
Rated output voltage	220VDC, 110VDC
Rated output current	6A, 10A, 12A, 20A, 30A, 40A, 50A, 60A, 70A, 80A, 90A, 100A, 120A, 130A, 150A, 180A, 200A, 260A, 300A, ...
Capacity of storage battery	7Ah, 10Ah, 20Ah, 38Ah, 65Ah, 100Ah, 150Ah, 200Ah, 300Ah, 500Ah, 600Ah, 800Ah, 1000Ah, 1500Ah, 2000Ah
Accuracy of voltage stabilization	≤±0.5%
Accuracy of current stabilization	≤±0.5%
Ripple coefficient	≤±0.1%
Frequency of power grid	50Hz±10%
Power factor	0.95% Full-load output
Insulation strength	>10M, 2kVAC no ashover or breakdown for 1min
Working mode	Long term continuous running
Cooling mode	Intelligent temperature-control type air cooling, high-effcient natural cooling
Audible noise	≤50dB

System features

6.1 Two circuits of alternating-current input transfer automatically, ensuring normal running of system;
6.2 Wide input voltage range, strong power grid adaptability;
6.3 Adoption of high-frequency switching power supply technology, modularized design, N+I hot standby, high reliability;
6.4 The rectifier module adopts live hot plug, convenient and quick daily maintenance;
6.5 High-accurate dynamic current sharing; independent, controlling or controlled running is available;
6.6 LCD screen, touch screen and colorized touch screen are available for selection, big screen with images and characters, has friendly interface, simple and convenient operation;
6.7 The monitor will carry out all-around monitoring and control to the running of system, it can realize system setting, information query, as well as "remote measurement, remote control, remote signaling, remote adjustment" four-remote function to the system through background monitoring and remote monitoring, realize unattended operation;
6.8 The monitor is able to control the voltage of storage battery, charging/discharging current and temperature compensation of storage battery accurately, has over/undervoltage and over-temperature alarm as well as fault alarm, ensuring optimum state of storage battery, prolong the service life of storage battery;
6.9 Functions of manual and automatic voltage regulation, as well as branch insulation detection;
6.10 Reliable lightning proof and excellent insulating protection measures, guaranteeing safety for system and person;
6.11 RS232 and RS485 two communication interfaces, and RTU, CDT, MODBUS three types of communication protocols issued by Ministry of Electric Power for selection;
6.12 With expansion interface, can switch in other external equipment;
6.13 It can realize two groups of storage battery independent charging and discharging management by adopting a set of monitoring system, two groups of storage battery, two groups of charging device and bus segment.

Note: It can be equipped with accident signal or distant signal alarm functions and inverter power, direct-current conversion module to carry out DC/AC and DC/DC conversion if it is required. See system configuration module description for detailed functions and operations.

JXF(JFF)

Control box

General

JXF(JFF) type is a control box equipped with control components and is combined with various control functions according to requirements. It adopts massive bottom plate and designed and installed according to user's installation component dimensions. It is applied to the single phase three wire or three phase five wire terminal circuits with rated voltage of 220V or 380V, and load single loop current not exceed 400A. It is a complete set used for performing secondary and long distance control for electrical equipments and protecting electrical equipments against over-load, short circuit, over voltage and leakage. The product is widely used at port, airport, factory, business zone, residential area and industrial and mining enterprises.

This product complies with GB7251.1 standard.

Model and meaning

□□□-□□/□

- Thickness
- Width
- Height
- "R" denotes embedded installation. Otherwise denotes surface installation
- "1" denotes metal door, "2" denotes perspective window
- "XF" denotes indoors, "FF" denotes outdoor control box.

Structural features

JXF(JFF) type control box is composed of cabinet, top cover, bottom plate and electrical switch components etc. The built-in switch components can be decided according to user's function require-ments. For the convenient connection for top and under side, switch hole is equipped(size: 180 × 85). It is with rubber sealing after leaving factory. User can dismantle and install by self when inlet and outlet is required. Two types of cabinets: clear installation (hanging on the wall) and embedded installation (built in the wall). Color: mainly Ronger Gray.

Main technical parameters

4.1 Rated working voltage: 230V, 400V
4.2 Rated working current: 400A
4.3 Rated short circuit breaking capacity: 80kA
4.4 Enclosure protection grade: IP55

DXF

Low-voltage cable branch box

General

DXF low-voltage cable branch box is a kind of electric cable to other equipment (non-power consumption equipment) to allocate power to install the outdoor installation of the closed sets of equipment, ground-mounted, column mounted, hanging and embedded into the type of 4, it is used for public three-phase system.

Products meet with GB7251.5 and IEC439-1(1992) and other standards.

Model and meaning

DXF □ □

- Rated current
- D means no open plane; I with a switch
- Name

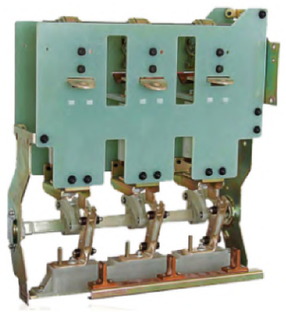
Structural features

3.1 The cabinet selection of 1.5mm thick cold-rolled steel or 1.2mm thick stainless steel production, the surface of the acid sprayed spray treatment, beautiful appearance.
3.2 The left and right sides of the box into the line,.the following outlet hole, easy access.
3.3 The cabinet has a main grounding point, easy to connect with the ground.
3.4 Box, baffle and other insulating parts with high heat and spark resistance, built-in or exterior parts with corrosion resistance and aging resistance.
3.5 The appearance of the protection grade is IP34D, when the cable is connected, the minimum protection grade is IP23C.

Main technical parameters

Item	Parameter
Rated insulation working voltage	400
Rated working voltage	AC380, AC220
Maximum rated current	100A
Short-time withstand current	6kA
Protection grade	IP30

Fully insulated, fully sealed and inflatable ring network switchgear accessories



AS-VE-12D/630A

GIS Vacuum circuit breaker with isolating switch

◆ General

AS-VE-12D circuit breaker has the advantages of easy installation, less maintenance, long service life, small size, economical price, safe and reliable, etc. This product complies with the technical requirements of GB1984-89, GB/T1984-2003 AC high voltage circuit breaker. The main circuit is 630A-20kA (4S) and 25kA (3S), and the mechanical life is 10000 times. Grounding circuit 20kA (2S), mechanical life 2000 times.

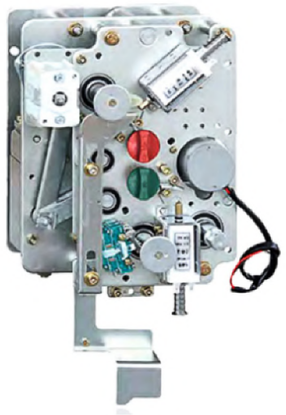
AS-VD-R01B

12kV Operating mechanism for vacuum circuit breaker



◆ General

The AS-VD series circuit breaker mechanism is an auxiliary equipment suitable for the closing and opening operations of the circuit breaker in the filled high-voltage ring main unit. Brake operation is controlled by compressed spring energy storage. The product has the function of reclosing and interlocking function when used in combination with the isolation mechanism. It has high reliability and the mechanical life can reach more than 10,000 times. This product complies with GB1984-2003 "Common Technical Requirements for High Voltage Switch -gear and Control Equipment Standards".

◆ Model and meaning

AS - V D - R 01 B

- B: Knob operation
- 01: 01 Normal; 02 With secondary wiring
- R: H=hard interlock; R=soft interlock
- D: Electric operation
- V: Circuit breaker mechanism
- AS: Enterprise code

◆ Instructions for operating

● Energy storage operation:

The upper cabinet of the mechanism is installed and fixed, put the special handle of the mechanism into the operating shaft located at the lower right of the mechanism, and rotate the handle clockwise until the "click" sound (at this time, the energy storage indicator shaft will push the energy storage to the fully closed state). Can be in place. During electric operation, the mechanism will automatically run energy storage after power on. After the energy storage is in place, the motor circuit will be disconnected, the energy storage will remain, and it will wait for the release of energy to close (the secondary circuit must be accurate during electric operation).

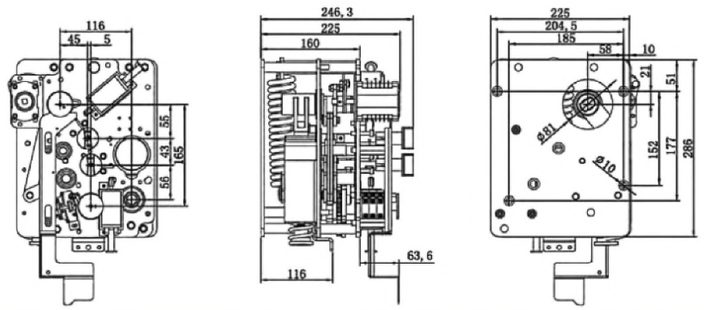
● Closing operation:

Turn the green knob counterclockwise during manual operation to instantly release the closing energy storage, and the mechanism pushes the circuit breaker switch to complete the closing of the main circuit. Power on the closing electromagnet coil during electric operation, the closing electromagnet acts instantaneously to release the stored energy, the mechanism pushes the circuit breaker switch to complete the closing of the main circuit, and at the same time stores energy for the opening spring (at this time, energy storage can be continued but Under the action of the anti-misoperation interlock, the re-closing operation cannot be performed).

● Opening operation:

During manual operation, turn the red knob counterclockwise to instantly release the stored energy for opening, and the mechanism pushes the circuit breaker switch to complete the opening of the main circuit. When the electric operation is performed, the coil of the opening electromagnet is energized, and the stored energy is released by the instantaneous action of the opening electromagnet, and the mechanism pushes the circuit breaker switch to complete the opening of the main circuit.

◆ Overall and installation dimensions



AS-VD-R01A

12kV Operating mechanism for vacuum circuit breaker

The AS-VD series circuit breaker mechanism is an auxiliary equipment suitable for the closing and opening operations of the circuit breaker in the filled high-voltage ring main unit. Brake operation is controlled by compressed spring energy storage. The product has the function of reclosing and interlocking function when used in combination with the isolation mechanism. It has high reliability and the mechanical life can reach more than 10,000 times. This product complies with GB1984-2003 "Common Technical Requirements for High Voltage Switch -gear and Control Equipment Standards".

◆ Model and meaning

AS - V D - R 01 A

- A: Button operation
- 01: 01 Normal; 02 With secondary wiring
- R: H=hard interlock; R=soft interlock
- D: Electric operation
- V: Circuit breaker mechanism
- AS: Enterprise code

◆ Instructions for operating

● Energy storage operation:

The upper cabinet of the mechanism is installed and fixed, put the special handle of the mechanism into the operating shaft located at the lower right of the mechanism, and rotate the handle clockwise until there is a "click" (at this time, the energy storage indicator shaft will push the energy storage to a completely closed state) to store energy in place. During electric operation, the mechanism will automatically run energy storage after power on. After the energy storage is in place, the motor circuit will be disconnected, the energy storage will remain, and it will wait for the release of energy to close (the secondary circuit must be accurate during electric operation).

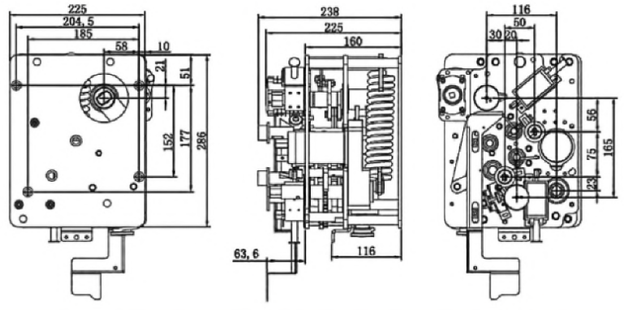
● Closing operation:

Press the green button to instantly release the closing energy storage, and the mechanism pushes the circuit breaker switch to complete the closing of the main circuit. Power on the closing electromagnet coil during electric operation, the closing electromagnet acts instantaneously to release the stored energy, the mechanism pushes the circuit breaker switch to complete the closing of the main circuit, and at the same time stores energy for the opening spring (at this time, energy storage can be continued but Under the action of the anti -misoperation interlock, the re-closing operation cannot be performed).

● Opening operation:

Press the red button to instantly release the stored energy for opening, and the mechanism pushes the circuit breaker switch to complete the opening of the main circuit. When the electric operation is performed, the coil of the opening electromagnet is energized, and the stored energy is released by the instantaneous action of the opening electromagnet, and the mechanism pushes the circuit breaker switch to complete the opening of the main circuit.

◆ Overall and installation dimensions



AS-FD-R02A

12kV Operating mechanism for load breaker switch

General

The AS-FD-R02A intelligent electric operation scheme adopts the MCU chip integrated circuit to intelligently judge the closing and opening state of the load switch, and conducts electric operation on the mechanism according to the customer's instructions, which can realize the local closing and opening functions and remote closing and opening. The brake function has the protection function of the motor undercurrent or stalled overload, and achieves the protection of the key components of the mechanism. The controller has the function of prompting the equipment failure signal, which provides great convenience for daily maintenance. The AS-FD-R02A conventional electric operation scheme adopts circuit board type terminal integration, and the electric operation of the mechanism is realized by the relay contact conver-sion in the controller. It is a universal and economical electric operation scheme for AC and DC.

Model and meaning

AS - F D - R 02 A

- A: Button operation
- 02: 01 Normal; 02 With secondary wiring
- R: H=hard interlock; R=soft interlock
- D: Electric operation
- F: Outlet mechanism
- AS: Enterprise code

Instructions for operating

● Closing operation:

Manual closing: the mechanism is installed and fixed on the upper cabinet, put the special handle of the mechanism into the operating shaft located on the upper part of the mechanism, rotate the handle clockwise about 90° , the scroll double spring of the mechanism is compressed and stored to complete the energy storage, press the closing button to close. The energy storage spring of the brake is released, and the main circuit of the load switch completes the closing under the energy release power of the mechanism.

Electric closing: the mechanism is powered on and a closing signal is given, and the controller of the mechanism will automatically judge the opening and closing of the load switch and the status of each interlocking circuit. If the state of each circuit reaches the condition for closing, the controller starts the closing electromagnet. Release energy to realize instantaneous closing of the main circuit of the load switch.

● Opening operation:

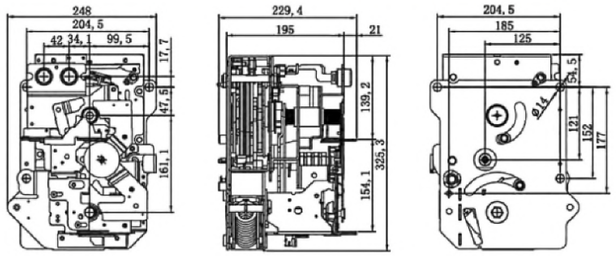
Manual opening: Press the opening button to release energy, and push the load switch to complete the main circuit opening action under the power of energy release. When the opening signal is given when the electric brake is opened, the controller will automatically judge the opening and closing position of the load switch and the status of each interlocking circuit. Realize the opening of the main circuit of the load switch. When the mechanism is in the open state, it can perform main circuit closing or grounding closing operations.

● Ground closing and opening:

Grounding closing: put the special handle of the mechanism on the grounding operation shaft at the lower part of the mechanism, rotate it clockwise about 90° , and then release the power storage spring instantly when it is compressed to the midpoint, and push the grounding switch to complete the grounding closing. At this time, the mechanism of the interlock is locked, and the main circuit cannot be closed.

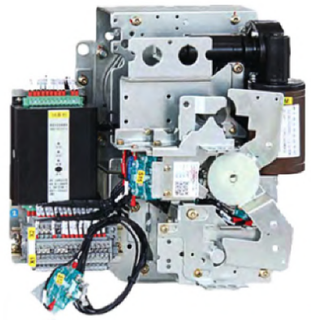
Grounding and opening: Put the special handle of the mechanism on the grounding operation shaft at the lower part of the mechanism, and rotate it counterclockwise about 90° . The lock is in the open state, and the load switch can be closed and opened.

Overall and installation dimensions



AS-CD-R01A

12kV Operating mechanism for load breaker switch



General

The AS-CD-R01A series incoming line operating mechanism is an auxiliary equipment suitable for the closing and opening operation of the load switch in the filled high-voltage ring main unit. The over-center energy storage of the spring controls the closing and opening actions of the grounding switch. The working position has three operating positions: closing, opening, and grounding. This series of products has five anti-interlocking functions.

The AS-CD-R01A intelligent electric operation scheme adopts the MCU chip integrated circuit to intelligently judge the closing and opening status of the load switch, and conducts electric operation on the mechanism according to the customer's instructions, which can realize the local closing and opening functions and remote closing and opening. The brake function has the protection function of the motor undercurrent or stalled overload, and achieves the protection of the key components of the mechanism. The controller has the function of prompting the equipment failure signal, which provides great convenience for daily maintenance.

- A: Button operation
- 01: 01 Normal; 02 With secondary wiring
- R: H=hard interlock; R=soft interlock
- D: Electric operation
- C: Incoming mechanism
- AS: Enterprise code

Instructions for operating

● Closing operation:

The mechanism is installed and fixed on the cabinet. Put the special handle of the mechanism on the operating shaft located on the upper part of the mechanism, and rotate the handle clockwise about 90° . When the volute spring of the mechanism is compressed to the critical point of energy release, it releases the energy and releases the energy, and pushes the load switch under the power of energy release to realize the closing of the main circuit.

● Partition operation:

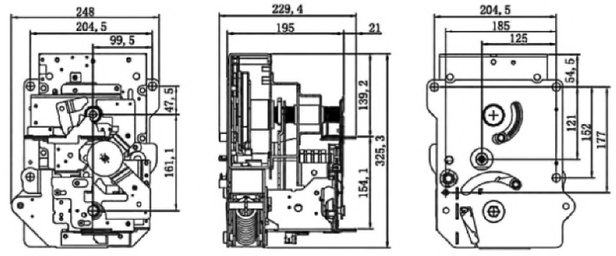
When manually opening the brake, put the special handle of the mechanism into the operating shaft located on the upper part of the mechanism, rotate the handle counterclockwise about 90° , the scroll spring of the mechanism is compressed to the energy release|critical point, and release the energy at the critical point, and push the load switch under the energy release power Complete the opening action of the main circuit.

● Ground closing and opening:

Grounding closing: Put the special handle of the mechanism on the grounding operation shaft at the lower part of the mechanism, and rotate it clockwise about 90° . When the grounding storage power spring dances, it releases energy instantly when the compression passes the midpoint, and pushes the grounding switch to complete the grounding closing. At this time, the mechanism The interlock is locked, and the main circuit cannot be closed.

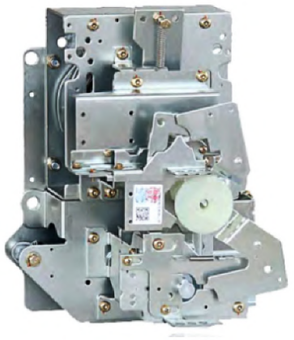
Grounding and opening: Put the special handle of the mechanism on the grounding operation shaft at the lower part of the mechanism, and rotate it counterclockwise about 90° . The interlock is in the open state, and the load switch can be closed and opened.

Overall and installation dimensions



AS-D-R01

12kV Operating mechanism for isolating switch



◆ General

The AS–D–R01 series isolation operating mechanism is suitable for supporting equipment for the opening and closing operation of the isolating switch and the grounding switch in the rechargeable high–voltage ring network cabinet. The overcenter energy storage of the spring controls the closing and opening actions of the grounding switch. The working position has three operating positions of closing, opening and grounding. This series of products has five anti –interlocking functions. This series of products leave the factory after passing the full inspection, in line with GB3804–2004 "3.6kV–40.5kV High Voltage AC Load Switches", GB3906–2006 "3.6kV–40.5kV AC Metal Enclosed Switchgear and Control Equipment", "Relevant Requirements of High Voltage AC Load Switch–Fuse Combined Apparatus".

◆ Model and meaning

AS - D R 01

- 01 Normal; 02 With secondary wiring
- H=hard interlock; R=soft interlock
- Isolation operation
- Enterprise code

◆ Instructions for operating

● Closing operation:

The upper cabinet of the mechanism is installed and fixed. Put the special handle of the mechanism into the operating shaft located on the upper part of the mechanism, and rotate the handle clockwise about 90° . When the scroll spring of the mechanism is positively charged to the energy release point, it will automatically release energy, and the energy release power will push the isolation switch. Complete the closing action. In the closing state, due to the antimisoperation interlocking lock, the grounding closing will not be able to operate.

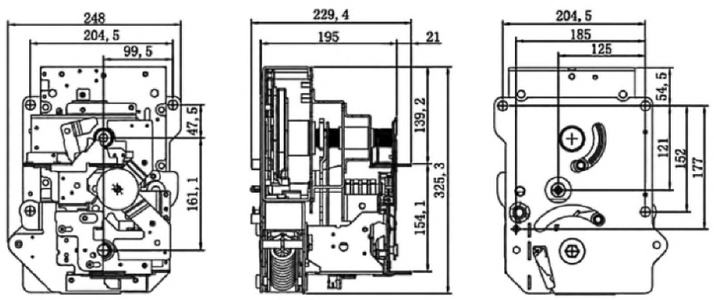
● Opening operation:

Put the special handle of the mechanism into the operating shaft located on the upper part of the mechanism, rotate the handle counter clockwise about 90° , the scroll spring of the mechanism will automatically release energy when it reverses to the energy release point, and the energy released will push the isolation switch to complete the opening action.

● Ground closing and opening:

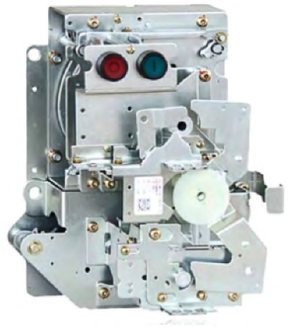
Grounding closing: When the mechanism is in the open state, put the special handle of the mechanism on the grounding operation shaft at the lower part of the mechanism, and rotate it clockwise about 90° . The grounding power storage spring releases energy instantly when the positive power storage passes the midpoint to push the grounding switch. After the grounding closing is completed, the interlock of the mechanism is locked at this time, and the main circuit cannot be closed. Grounding and opening: Put the special handle of the mechanism on the grounding operation shaft at the lower part of the mechanism, and rotate it counterclockwise about 90° . The interlock is in the open state, and the main circuit can be closed and opened.

◆ Overall and installation dimensions



AS-F-R01A

12kV Operating mechanism for load breaker switch



◆ General

The AS–F–R01A series manual outlet operating mechanism is an auxiliary equipment suitable for the load switch table and opening operation in the filled high–voltage ring network cabinet. This series of mechanisms adopts planar scroll spring energy storage to control the closing and opening of the load switch. The over–center energy storage of the spring controls the closing and opening actions of the grounding switch. The working position has three operating positions: closing, opening, and grounding. This series of products has five–proof interlocking functions.

The AS–FD–R01A hand–closed electric outlet mechanism is an electric opening electromagnet added to the KJF–12 manual outlet mechanism, and the user can power on the electromagnet locally or remotely to realize the electric opening action.

◆ Model and meaning

AS - F - R 01 A

- Button operation
- 01 Normal; 02 With secondary wiring
- H=hard interlock; R=soft interlock
- Outlet mechanism
- Enterprise code

◆ Instructions for operating

● Manual closing operation:

The upper cabinet of the mechanism is installed and fixed, put the special handle of the mechanism into the operating shaft located on the upper part of the mechanism, rotate the handle clockwise about 90° , the scroll double spring of the mechanism is compressed and stored to complete the energy storage, press the close button, and the power storage spring is closed. The energy is released, and the main circuit of the load switch completes the closing under the energy release power of the mechanism.

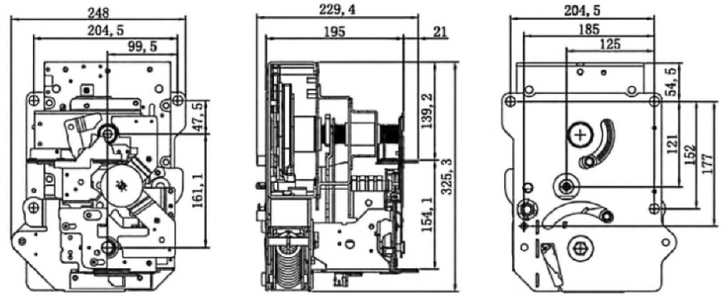
● Manual opening operation:

When the opening button is pressed, the energy storage spring of the opening is released, and the main circuit of the load switch completes the opening under the energy release force of the mechanism. In the opening state, energy storage or grounding operation can be performed again.

● Electric opening operation:

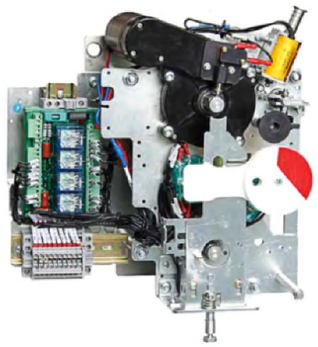
The hand–closed electric switch mechanism can realize electric instant switch–off by powering on the switch–off electromagnet coil in the close–position state.

◆ Overall and installation dimensions



AS-FD-H02

12kV Operating mechanism for load breaker switch



General

The AS-FD-H02 series outlet operating mechanism is an auxiliary equipment suitable for the closing and opening operation of the load switch in the inflatable high-voltage ring network cabinet. The over-center energy storage of the spring controls the closing and opening actions of the grounding switch. The working position has three operating positions: closing, opening, and grounding. This series of products has five anti-interlocking functions.

The AS-FD-H02 conventional electric operation scheme adopts circuit board type terminal integration. The electric operation of the mechanism is realized by the relay contact conversion in the controller. It does not have motor protection function and fault prompt function. It is an economical electric operation scheme. This series of products leave the factory after passing the full inspection, in line with GB3804-2017 (3.6kV-40.5kV High Voltage AC Load Switches), GB3906-2020 (3.6kV-40.5kV AC Metal Enclosed Switchgear and Control Equipment), Relevant requirements of " Switch, Fuse Combined Electrical Appliances" and GB/T11022-2020 (Common Technical Requirements for High Voltage AC Equipment and Control Equipment Standards).

Model and meaning

AS - F D - H 02

- 01 Normal; 02 With secondary wiring
- H=hard interlock; R=soft interlock
- Electric operation
- Outlet mechanism
- Enterprise code

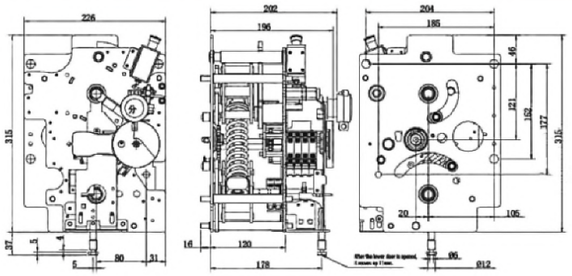
Instructions for operating

● Closing operation:
After checking and confirming that the product is normal and without deformation, install and fix the mechanism and load switch on the air box of the outlet cabinet through three-position dynamic fit. After 10 correct manual operations without failure, pull out the handle, and press the green closing electric button in the position of the mechanism, so that the motor drive mechanism can store energy, and drive the load switch to automatically close the main circuit immediately. This closing can only be operated in the state of grounding. When the load switch is in the closing state, the grounding operation hole will be closed by the opening and closing sign. At this time, the user must not violate the sign to forcibly operate the grounding, otherwise it will violate the five-proof operation requirements.

● Opening operation:
After the mechanism is closed, when it is necessary to open the gate, you only need to press the red electric switch to open the main circuit of the load switch. This opening can only be operated after the mechanism is closed, otherwise the mechanism closes unsuccessfully. After opening, the main switch closing or grounding closing operation can be performed.

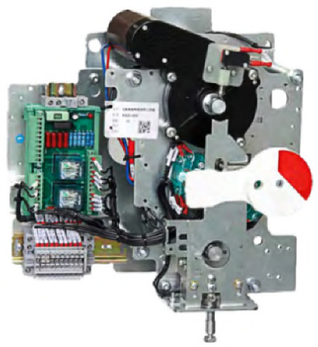
● Grounding operation:
When the main switch is in the position position, insert the special handle onto the hexagonal shaft in the lower half, turn it clockwise about 90 degrees to close the grounding loop, and turn it counterclockwise about 90 degrees to disconnect the grounding loop. This grounding operation can only be done manually. When the grounding is in the closed state, the load switch operation hole will be closed by the opening and closing sign. At this time, the user must not violate the sign to forcibly operate the load switch, otherwise it will violate the five-proof operation requirements. When the grounding is in the closed state, the load switch operation hole will be closed by the opening and closing sign. At this time, the user must not violate the sign to forcibly operate the load switch, otherwise it will violate the five-proof operation requirements.

Overall and installation dimensions



AS-CD-H02

12kV Operating mechanism for load breaker switch



General

The AS-CD-H02 series incoming electric operating mechanism is a pull-type electric hard-connected mechanism in the high-voltage ring network cabinet SF6 inflatable cabinet. It has three operating stations for closing, opening, and grounding, and five anti-interlock functions.

This series of products will leave the factory after passing the full inspection, in line with GB3804-2017 "3.6kV-40.5kV High Voltage AC Load Switches", GB 3906-2020 "3.6kV-40.5kV AC Metal Enclosed Switchgear and Control Equipment" "High Voltage AC Load Switches". Relevant requirements of "Fuse Combination Electrical Appliances", GB/T11022-2020 "Common Technical Requirements for High Voltage AC Equipment and Control Equipment Standards".

Model and meaning

AS - C D - H 02

- 01 Normal; 02 With secondary wiring
- H=hard interlock; R=soft interlock
- Electric operation
- Incoming mechanism
- Enterprise code

Instructions for operating

● Closing operation:
After checking and confirming that the product is normal and without deformation, install and fix the mechanism and load switch on the air pressure box of the incoming cabinet through three-position dynamic fit. After 10 times of manual operation without failure, pull out the handle, and press the green closing electric button in the position of the mechanism, so that the motor drives the mechanism and drives the load switch to close the main circuit immediately. This closing can only be operated in the grounding position state, otherwise the operation cannot be completed. When the load switch is in the closing state, the grounding operation hole will be closed by the opening and closing sign. At this time, the user must not violate the sign to forcibly operate the grounding, otherwise it will violate the five-proof operation requirements.

● Opening operation:
After the mechanism is closed, when it is necessary to open the gate, you only need to press the red electric switch to open the main circuit of the load switch. This opening can only be operated after the mechanism is closed, otherwise the mechanism closes unsuccessfully. After opening, the main switch closing or grounding closing operation can be performed.

● Grounding operation:
When the main switch is in the position position, insert the special handle onto the hexagonal shaft in the lower half, turn it clockwise about 90 degrees to close the grounding loop, and turn it counterclockwise about 90 degrees to disconnect the grounding loop. Do not and cannot close the main switch circuit after grounding and closing. This grounding operation can only be done manually. When the mechanism is electric, it needs to be manually operated 30 times first, and it needs to be operated 30 times with the power-on button instead of the handle. When the grounding is in the closing state, the load switch operation hole will be closed by the opening and closing sign. At this time, the user must not violate the sign to forcibly operate the load switch, otherwise it will violate the five-proof operation requirements.

DISTRIBUTION BOX AND ENCLOSURE

YUEQING AISO ELECTRIC CO.,LTD.
www.aisoelectric.com

JP

Integrated distribution box (compensation/control/terminal/lighting)

◆ General

JP series outdoor integrated power distribution box is a comprehensive power distribution device with the functions of metering, outgoing and reactive power compensation. It has the functions of short circuit, overload, over-voltage, leakage protection and so on. The utility model has the advantages of beautiful appearance, economy and practicability, and is installed on the pole of an outdoor column and transformer, and is a new generation of ideal distribution product for urban and rural power grid transformation.

◆ Model and meaning

JP – □ / □

- Main circuit scheme number
- Transformer capacity
- Integrated distribution box

◆ Working conditions

3.1 Environmental temperature: −25℃ ~ +40℃;
3.2 Air relative humidity: daily average value ≤90%, the average monthly value ≤90%;
3.3 Elevation: ≤2000m;
3.4 Installed in the absence of severe shock and shock, non corrosive gas sites.

◆ Structural features

The structure of the case is discrete and horizontal. The shell adopts 2mm high quality non pound steel plate. It is made of multi fold flanging (or stainless steel double sandwich plate with honeycomb structure). It has flame retardance, environmental protection, heat insulation and anti condensation performance) adopt special stainless steel welding technology, the whole strength of the box is high, the surface is bright and clean, such as the mirror, without leaving the trace of welding seam; the internal installation of beam (plate) is hot-dip galvanized process, to ensure that twenty years without corrosion; The front and back door of the box body is convenient for the user to operate and examine and repair. The door is surrounded by a high elasticity aging resistant sealing strip, and each door is provided with two door locks of light and shade, and the transparent lock is provided with an anti blocking and rust proof rainproof cover; the measuring chamber is fully enclosed. Closed with a sealing device; the side of the box is equipped with cable lines into the proof of foreign body wear tube, bottom ventilation holes and the cable outlet hole is arranged on the top of a ventilation channel and screen, waterproof, dustproof, anti rust, anti foreign body function, protection grade: IP54.

Main technical parameters

No.	Item	Unit	Parameter
1	Transformer capacity	KVA	30~400
2	Rated working voltage	V	AC400
3	Auxiliary circuit operating voltage	V	AC220, AC380
4	Rated frequency	Hz	50
5	Rated current	A	≤630
6	Rated leakage action current	mA	30~300 adjustable
7	Protection grade		IP54

XM

Integrated distribution box

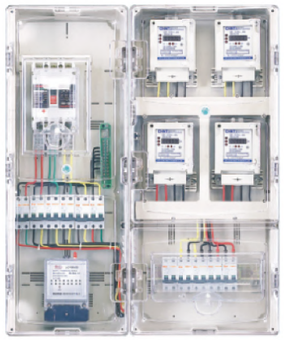
◆ General

XM distribution box is suitable for three-phase four wire power system with three-phase AC 50Hz, rated voltage of 220/380V and rated current of less than 400A, which is used for receiving and distributing electric energy. It is widely used for power distribution, lighting, metering and other purposes in factories, mining enterprises and civil buildings. The product has the characteristics of good safety, flexible electrical scheme, convenient combination, strong seriality and practicability, novel structure and high protection grade.

◆ Main technical parameters

Item	Unit	Electrical parameters
Rated insulation voltage	V	660
Rated working voltage	V	380
Rated working current	A	400
Frequency	Hz	50
Rated short-time withstand current	kA	10
Rated peak withstand current	kA	17

Meter box



◆ General

Electricity meter box is a new type of product we designed to meet the needs of electricity safety for multi-storey residential, which features safety, economy, practicality, and reliability. The products have good performance on line and electrical overload short circuit protection, human body electric shock protection, and has advantages of easy installation, versatile series, strong practicality, novel structure, and high protection level.

Shape and structure can be made according to user needs.

This series of meter boxes is suitable for civil residential buildings, residential quarters, low-voltage grid, schools, hotels, and other places with electricity system of a frequency of 50Hz, rated working voltage of 380V or 220V, and working current below (100A).

◆ Model and meaning

□ - □ / □

- Number of phases of electricity meter: 3: three-phase; 1: single-phase (can be omitted)
- Meter digits: 4:4 digits: 6:6 digits: 9:9 digits: 12:12 digits: 15:15 digits
- Meter box

MDB-B

Three-phase distribution box (IP65)

Application

MDB-B series three-phase distribution box is widely used in the family, high building, house, station, port, airport, commercial house, hospital, cinema, enterprises and so on occassions.

Material

2.1 Steel sheet and copper fittings inside;
2.2 Paint finish: Both externally and internally;
2.3 Protected with epoxy polyester coating;
2.4 Textured finish RAL7032 or RAL7035.

Lifetime

3.1 More than 20 years;
3.2 Our products are accord with IEC 60947-3 standard.

Overall and installation dimensions

Surface type model	No.of ways	Dimensions(mm)		
		W	H	D

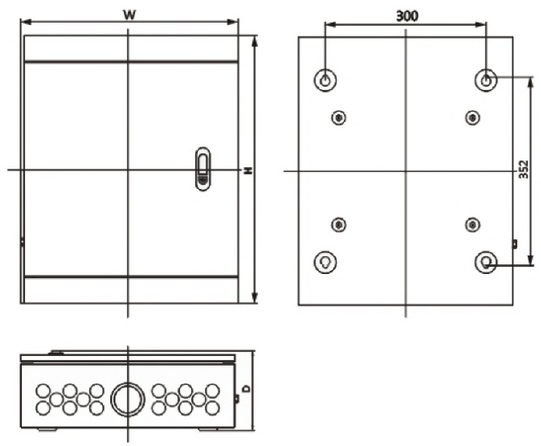
Three phase, Standard Consumer Unit-100Amp main DP Switch/DP RCD



MDB-V

One-phase distribution box (IP65)

Application

MDB-V series one-phase distribution box is designed for safe, reliable distribution and control of electrical power as service entrance equipment in residential, commercial and light industrial installations.

Material

2.1 Steel sheet with PC glass, and copper fittings inside;
2.2 Paint finish: Both externally and internally;
2.3 Protected with epoxy polyester coating;
2.4 Textured finish RAL7032 or RAL7035.

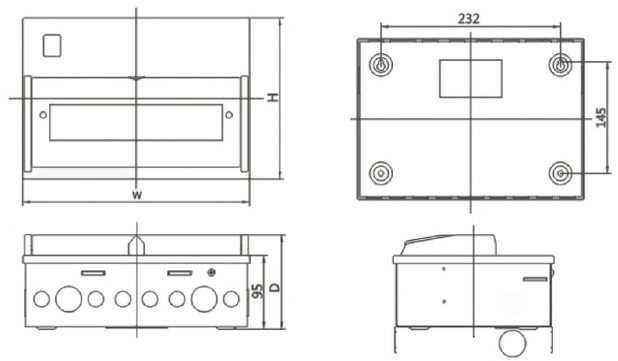
Lifetime

3.1 More than 20 years;
3.2 Our products are accord with IEC 60947-3 standard.

Specifications

Model	No.of ways	Rating current
Supplied with main switch and busbar		
MDB-V5	5 ways	100A
MDB-V8	8 ways	100A
MDB-V11	11 ways	100A
MDB-V14	14 ways	100A
Supplied with RCCB and busbar		
MDB-V5R	5 ways	80A 30mA
MDB-V8R	8 ways	80A 30mA
MDB-V11R	11 ways	80A 30mA
MDB-V14R	14 ways	80A 30mA

Overall and installation dimensions



MDB-N

One-phase distribution box (IP65)

◆ Application

MDB-N series one-phase distribution box which provided with new construction and reliable capacity is applied to indoor electrical system to protect distribution switches with the capacity of delay and protecting the circuit from overload. The box is composed of Zero line and N line terminal and can be divided into flush install and surface install.

◆ Material

2.1 Steel sheet and copper fittings inside;
2.2 Paint finish: Both externally and internally;
2.3 Protected with epoxy polyester coating;
2.4 Textured finish RAL7032 or RAL7035.

◆ Lifetime

3.1 More than 20 years;
3.2 Our products are accord with IEC 60947-3 standard.

◆ Overall and installation dimensions

MDB-N

Distribution box (Chassis enclosure type) (IP65)

◆ Application

MDB-N series distribution box (chassis enclosure type) which provided with new construction design is used for modular equipment with adjustable distance between the 35mm. Symmetrical profile and cover plate from 40 to 85mm. Chassis made of galvanized steel. Blank cover plate and metal frame painted with RAL-7032. Terminal blocks for earth and neutral wiring circuit identi-fication system supplied as standard.

◆ Material

2.1 Steel sheet and copper fittings inside;
2.2 Paint finish: Both externally and internally;
2.3 Protected with epoxy polyester coating;
2.4 Textured finish RAL7032 or RAL7035.

◆ Lifetime

3.1 More than 20 years;
3.2 Our products are accord with IEC 60947-3 standard.

MDB-H

One-phase distribution box (New type)(IP65)

◆ Application

MDB-H series one-phase distribution box (New type) is with impressive features to make the enclosure a suitable addition to any high-tech equipment installation.

◆ Material

2.1 Steel sheet and copper fittings inside;
2.2 Paint finish: Both externally and internally;
2.3 Protected with epoxy polyester coating;
2.4 Textured finish RAL7032 or RAL7035.

◆ Lifetime

3.1 More than 20 years;
3.2 Our products are accord with IEC 60947-3 standard.

◆ Overall and installation dimensions

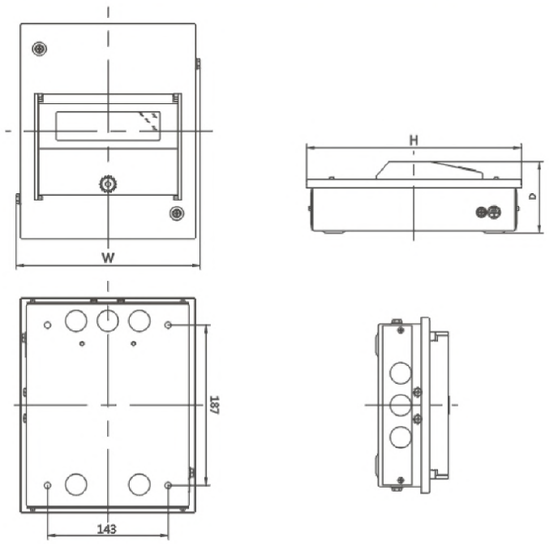
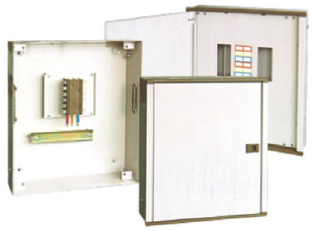
MDB-H-SPN-12	12 ways	349	252	90





MDB-H

Three-phase distribution box (New type)(IP65)

◆ Application

The MDB-H distribution boards are available with a fixed load or split load pan assembly. They have a fully flush fitted metal door with a "slam" type catch. All boards are delivered with both Neutral and Earth bars fitted and the neutral is designed to wrap around the incoming device to ensure that extra wiring space is available for the outgoing devices.

The incoming device must be selected and fitted by the installer. The top and bottom gland plates are removable and also include knock-outs to suit standard size conduits. The pan assembly is fully shrouded and the busbars are one piece in design, this ensures that no "hot spots" can occur as there are no mechanical joints. The boards conformed to BSEN60439-1 & 3.

◆ Overall and installation dimensions

Model	No.of ways	Dimensions(mm)

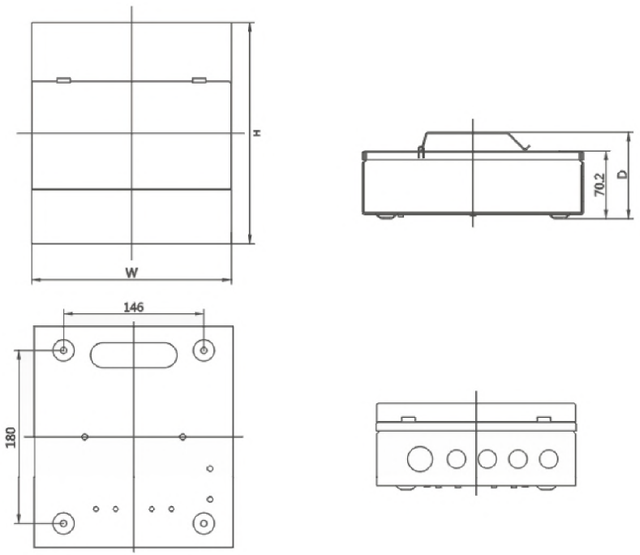
MDB-H-TPN-12	12 ways	405	677	118



MDB-C

One-phase distribution box (IP65)

Application

MDB-C series one-phase distribution box is applied to the terminal protection distribution board. The distribution box is made of high quality galvanized steel sheet of up to 0.6-1.2mm thickness.

Material

2.1 Steel sheet and copper fittings inside;
2.2 Paint finish: Both externally and internally;
2.3 Protected with epoxy polyester coating;
2.4 Textured finish RAL7032 or RAL7035.

Lifetime

3.1 More than 20 years;
3.2 Our products are accord with IEC 60947-3 standard.

MDB-TY

Three-phase distribution box (New type)(IP65)

Application

MDB-TY series new distribution box which can be individed into flush and surface installation, apply to the circuit of single phase 3 lines or three phase 5 lines of AC50Hz, 220V/380V, 100A or below, and as one of electric set to control and protect the overload, short circuit, over voltage and leakage of electric equipment. It can be widely used in the family, high building, house, station, port, airport, commercial house, hospital, cinema, enterprises and so on occassions. The installation is very simple and the appearance is good.

MGS-M

Gear switch (IP65)

Application

MGS-M series gear switch is mainly applied to the distribution network of the industrial and mining enterprises as cable conductor, protect the circuit from overload and short circuit and connect and break power in the normal lock power condition.

Material

2.1 Steel sheet and copper fittings inside;
2.2 Paint finish: Both externally and internally;
2.3 Protected with epoxy polyester coating;
2.4 Textured finish RAL7032 or RAL7035.

Lifetime

3.1 More than 20 years;
3.2 Our products are accord with IEC 60947-3 standard.

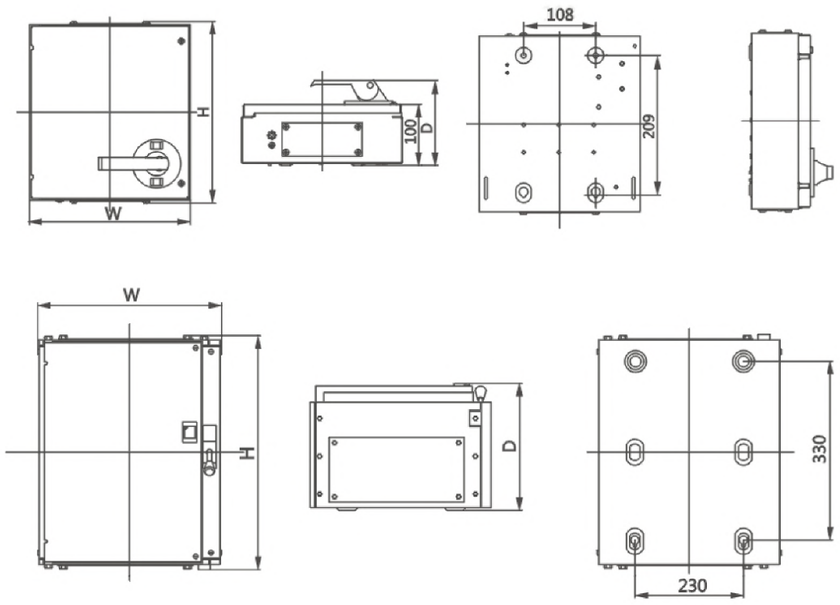
Overall and installation dimensions



Site distribution box

◆ Application

The site distribution box is to assemble the switchgear, measuring instruments, protective appliances and auxiliary equipment in the closed or semi closed metal cabinet or panel according to the electrical wiring requirements to form a low-voltage distribution device. During normal operation, the circuit can be connected or disconnected with the help of manual or automatic switch. In case of fault or abnormal operation, cut off the circuit or give an alarm with the help of protective appliances. The measuring instrument can display various parameters in operation, adjust some electrical parameters, and prompt or signal the abnormal working state. Commonly used in substation.

◆ Product features

2.1 Simple design and convenient construction;
2.2 Low comprehensive cost and investment saving;
2.3 Long service life and beautiful appearance;
2.4 One time investment and lifetime benefit;
2.5 Safety, environmental protection, reliable operation and simple maintenance;
2.6 The process reflects the technical level and is safe to use without worries.

Modern electrical control system electronic control equipment

◆ Application

Modern electrical control system electronic control equipment, precision sheet metal supporting solution, custom-tailor, skilled sheet metal working.

Network cabinet, UPS cabinet, EPS cabinet

◆ Application

Network cabinet, UPS cabinet, EPS cabinet, etc., good and stable quality, rich product line, beautiful appearance, customizable

Shell of power supply box and distribution box

◆ Application

The shell of power supply box and distribution box is artistic, solid, beautiful and anti-corrosion. It adopts high-quality electro galvanized plate for anti-corrosion. The shell of the distribution box can be selected step by step according to the capacity and control circuit, with reasonable product structure, safe operation and convenient disassembly. The protection grade can reach IP65.
